No argument from me! It is going up as planned as soon as the new
General gets a little more time to work with me on the project.

The hillside we are working on is a little tricky for us to deal with
while snow covered but in this part of North Carolina it does not snow
often or stay long.

We need to keep his enthusiasm up with some positive results.

```
Posted-By: auto-faq 3.3.2 beta (PGPMoose V2.0, Perl 5.005)
Archive-name: radio/ham-radio/moderated/crossposting
Revision: 1.1 2009/04/12 19:42:04
Posting-Frequency: posted monthly
URL: http://www.panix.com/~rram/usenet/rram/index.html

Changes followed by "|".

After a 30-day public discussion and feedback period to gauge reader
opinions in March of 2009:

http://groups.google.com/group/rec.radio.amateur.moderated/browse_thread/thread/d7d337db35
f23326

the rec.radio.amateur.moderated Moderation Team has decided to consider
amending its charter, and permit limited simultaneous crossposting to
rec.radio.amateur.moderated and one other unmoderated
amateur-radio-related discussion newsgroup. We are currently trying
this on a temporary basis (90 days, through early July 2009), and adopt
it permanently if successful.

Approved rec.radio.amateur.* newsgroups are those that are currently
listed in the latest version of the "List of Big Eight Newsgroups" which
is crossposted monthly to news.announce.newgroups, news.groups, and
news.lists.misc.

Approved alt.radio.amateur.* and alt.ham-radio.* newsgroups are those
that have been created consistent with the suggestions in "So You Want
to Create an Alt Newsgroup" at:

http://www.faqs.org/faqs/alt-creation-guide/

Approved regional hierarchy newsgroups are those that contain either
"radio.amateur" or "ham-radio" in their names, including
uk.radio.amateur and aus.radio.amateur.misc.

We will make every reasonable effort to keep our list of approved
newsgroups up-to-date. In case we have overlooked any, and a submission
is rejected in error as a result, the rejected submitter can E-mail us
at our administrative contact address (in the signature at the bottom of
this article, and the default Reply-To for the rejection message)
requesting that it be added, and that the article be approved. We may
still choose to reject articles crossposted to any alt.* newsgroup with
an inappropriate name, including obscene language, embedded
name-calling, or encouragement of unlawful conduct.
```

Please direct any comments, questions, or criticisms to
rec-radio-amateur-moderated-request@panix.com.

>you have a poor search engine, i get 6M hits... and all of them are
either for 'electric field' or 'electromagnetic wave'. provide a
formula or specific reference.

Write: ("electric wave equation") and your search engine will be poor.

For EM waves: "Maxwell's contribution to science in producing these
equations lies in the correction he made to Ampï¿½re's circuital law in his
1861 paper On Physical Lines of Force. He added the displacement current
term to Ampï¿½re's circuital law and this enabled him to derive the
electromagnetic wave equation in his later 1865 paper A Dynamical Theory of
the Electromagnetic Field and demonstrate the fact that light is an
electromagnetic wave".

And:
"Heaviside worked to eliminate the potentials (electric potential and
magnetic potential) that Maxwell had used as the central concepts in his
equations;[21] this effort was somewhat controversial,[25] though it was
understood by 1884 that the potentials must propagate at the speed of light
like the fields, unlike the concept of instantaneous action-at-a-distance
like the then conception of gravitational potential.[22] Modern analysis of,
for example, radio antennas, makes full use of Maxwell's vector and scalar
potentials to separate the variables, a common technique used in formulating
the solutions of differential equations. However the potentials can be
introduced by algebraic manipulation of the four fundamental equations."

Electric waves are normal pressure waves. In place of pressure is the
voltage. In Heaviside's no voltage. But "However the potentials can be
introduced by algebraic manipulation of the four fundamental equations."

Nice manipulations.

sorry, this is not correct. site a CURRENT source for this
statement. you did a good job quoting the proper relations between
potentials and fields, why not for 'electric waves'? if there are so
many good references that your search shows up there must be one that
provides a current good description of them.

> In Heaviside's no voltage. But "However the potentials can be
> introduced by algebraic manipulation of the four fundamental equations."

of course, potentials are not required, they are a figment of the
equations. what is required are the fields. the potentials, as you
quote:

> Modern analysis of,
> for example, radio antennas, makes full use of Maxwell's vector and scalar
> potentials to separate the variables, a common technique used in formulating
> the solutions of differential equations.

are just a 'technique' used to solve the equations, they are not the
result. there are many techniques like that used to solve
differential equations, they often introduce new variables that have
no physical meaning but are useful to simplify the equations leading
to a useful result. as you quoted above, even heaviside realized the
potentials and therefore the separate electric and magnetic 'waves'
were not necessary to the solution so he eliminated them. while this
may have provided a simpler representation of Maxwell's equations, it
did not change the results that they represented.

In Maxwell's time were math for the longitudinal waves. I am sure that were
such for electric waves also. But I am not interested in equations.
Maxwell did the math for the rotational oscillations. It is still in use in
engines area.

What Heaviside did I do not know because I do not understand in what way the
magnetic whirl appears around the wire.
It is only the piece to teach the math.

The topic is if the damped radio waves exhibit "redshift" with the distance.

No, the topic that you asked about is do sidebands change with distance.

But, yes radio waves do experience Doppler shift, damped or otherwise!

Jeff

of course there was, because they didn't know any better yet. all
those theories have been proven wrong and dropped 100 years ago. if
you want to talk waves you MUST use the equations, they are what
provides the description of the fields. Maxwell did math for lots of
things unrelated to electromagnetics, that was a very interesting
time.

no, damped waves do not exhibit redshift with distance, unless of
course they are from a distant galaxy that is moving away from us
rapidly!

One sideband is "redshifted" and the second "blueshifted". AM waves have the
increasing/decreasing amplitudes. The damped also but there no symmetry.
Were the sidebands symmetric at the damped waves?
>
> But, yes radio waves do experience Doppler shift, damped or otherwise!

It is not distance dependent.
S*

Seperate "electric field", "magnetic field", gravity field" are for kids.

Charged body at rest produces the electric field but a moving body do not
produce the electric field but magnetic.
Do you understand it?

> Maxwell did math for lots of
things unrelated to electromagnetics, that was a very interesting

Wiki wrote: "They initially interpreted these redshifts and blue shifts as
due solely to the Doppler effect, but later Hubble discovered a rough
correlation between the increasing redshifts and the increasing distance of

galaxies. Theorists almost immediately realized that these observations could be explained by a different mechanism for producing redshifts. Hubble's law of the correlation between redshifts and distances is required by models of cosmology derived from general relativity that have a metric expansion of space.[16] As a result, photons propagating through the expanding space are stretched, creating the cosmological redshift."

Photons are stretched with the distance.
Damped waves are like photons.

do you understand that the electric field from a charged body at rest
does not propagate, it is static everywhere so there are no waves.

but what about if the body is at rest in one inertial frame and you
are moving past it in another one, do you see a magnetic field or
not?

now that is a good laugh... stretching photons would be quite a trick
since they don't exist in Maxwell's equations. damped waves may be
made of many photons, but they are not 'like' photons... they are just
another set of em waves propagating along just like any other.

The only trouble for kids to remembe are the "hand rules".
Kids do not try to understand. They must remember.
Good memeory is most important in schools.

But in antennas charge appears and disappears. Electric waves must appear.
Some Authors call them electrostatic waves.

No. No magnetic charge and no magnetic field.

Babbling nonsense.

Most of space is empty vacuum and "waves in plasma" has absolutely nothing
to do with real antennas, either on Earth or in space.

sure, and in the rare plasma of most of space omega-p goes to zero so
the remaining waves are pure electromagnetic. you can only support
those other wave types in a dense plasma as in the lower levels of the
solar atmosphere or in a confined plasma in a laboratory. you might
as well take the basic Maxwell's equations and claim they don't work
on the Earth's surface because air has a different dielectric constant
that in space... while this is true, the results are rarely measurably
different than free space.

19. Antennas for Kenwood TH-F6A

Hi - I'm an amateur radio newbie - don't even have a license yet (taking the Technician exam 1/15). I have a Kenwood TH-F6A and I'm looking for an antenna for use from home. This looks like a good one - and it's in my price range ;-) I'm wondering what you experts think of it for a beginner?

http://www.diamondantenna.net/d130j.html

Also, I thought this might make a good mobile antenna. But the instructions say don't use a magnetic mount. I'm really not interested in any kind of permanent mount. Why do they say not to use a magnetic mount?

http://www.diamondantenna.net/d220.html

Thanks in advance for taking the time to answer.

In plasma are electrons and ions. Like in metals.

Tesla known that: http://www.tfcbooks.com/tesla/1929-09-22.htm

":Up to 1896, however, I did not succeed in obtaining a positive
experimental proof of the existence of such a medium. But in that year I
brought out a new form of vacuum tube capable of being charged to any
desired potential, and operated it with effective pressures of about
4,000,000 volts. I produced cathodic and other rays of transcending
intensity. The effects, according to my view, were due to minute particles
of matter carrying enormous electrical charges, which, for want of a better
name, I designated as matter not further decomposable. Subsequently those
particles were called electrons."

You are still before the electron time:

""When Dr. Heinrich Hertz undertook his experiments from 1887 to 1889 his
object was to demonstrate a theory postulating a medium filling all space,
called the ether, which was structureless, of inconceivable tenuity and yet
solid and possessed of rigidity incomparably greater than that of the
hardest steel. He obtained certain results and the whole world acclaimed
them as an experimental verification of that cherished theory. But in
reality what he observed tended to prove just its fallacy".

But you are fine. Nothing wrong.

Hi Richard,

Leave it at unconventional - that word's definition is well
understood.

>3. The relative field radiated by a conventional 1/4-wave vertical
>monopole
>driven against a perfectly conducting ground plane always is maximum
>in the
>horizontal plane. Such a system radiates virtually 100% of the matched
>power
>applied to its input terminals.

This reveals a common flaw found in vertical antenna analysis when
compared to AM antenna measurement conventions. Simply put, if you
lift the antenna off of an infinite plane, you lose 3dB. It is
demonstrable with even the meagerest of antenna modelers.

Chip's antenna is in the air, not on an infinite plane. A solid disk
replacing a field of radials does NOT constitute a replacement for an
infinite plane such as to recover the 3dB. This might account for the
bookkeeping error in the vendor's favor.

I believe somewhere in the tightly scripted presentation it was
asserted that there was no "figure 8" pattern as one would expect of
an antenna in free space.

The antenna is "apparently" in an anechoic chamber - or free space as
closely as can be approximated. There are no reports of the far field
envelope shape.

So let's mark it up to Chip's usual technique of loose suggestion
being passed off as a citation to then be wrapped back as a proof.

>Therefore the peak gain of that antenna system at resonance cannot be
>improved
>by putting a sleeve of any kind on the monopole.

I would dispute that. The evidence is sufficient insofar as the indication of change in the before/after display on instrumentation. Unless this is some form of parsing what "peak gain" means. What you write immediately following already conforms to that instrument display:
>
>The sleeve may change the shape of the radiation pattern of the system
>without
>the sleeve, though, which could change the field intensity at the
>location of
>the receiving antenna used in the test. This could account for the ~3
>dB
>improvement shown in their results when using the sleeve.

And by what you say above, this is the entirety of it. A thicker radiator - nothing less than has been covered in text for decades. You observe that below.

>4. Nothing is shown in the video about the amount of matched power at
>the
>feedpoint with and without the sleeve. If that is not held constant
>then the
>test will be flawed.

The instrumentation already takes care of that, and is discussed early in the presentation. I was doing this kind of bench work, with this kind of instrumentation, in this band, 20 years ago.

>5. The VSWR bandwidth of a monopole may be increased simply by using a
>larger
>cross-section conductor of "non-fractal" construction.

Of course - but that information doesn't sell product.

Hi Ron,

Welcome to the possibly the last vestige of Amateur Radio hardware
experimentation.

Insofar as your antenna goes, it presents you with a learning
opportunity that far exceeds the material you will be tested for.
However, it does embody the significant first principles.

1. The correlation between physical size and wavelength.
2. The discussion of match.
3. Unfortunately it says nothing of the radiation pattern which has
very serious implications for use.

Let's return to item 1 and examine the antenna. The overall height
can be rounded to 2 meters for simplicity's sake (there is no reason
to be exact and this is sufficiently accurate enough for the moment).
Your coax connection goes somewhere near the middle of the structure
to make it a dipole - a vertical dipole of unusual shape, but still
within the terms of first principles, a dipole.

This makes it suitable for use on the 4M band by simple correlation
between size and wavelength. However, there is no 4M amateur band,
and the vendor claims down to 10M and below.

The paragraph above marks our transition in the discussion towards
match. By virtue of its shape (its unusual shape), it benefits from
being a match at frequencies that are outside of its 4M native band.
This is true for the frequencies on BOTH sides of this band. The long
and short of it is that YES, the antenna is a suitable load over the
entire range of frequencies, and this is of high interest to any Ham.

However, being a suitable load to your transmitter (the antenna
matching the transmitter's requirement for a particular size value,
often 50 Ohms resistive with little or no reactance) is only half of
what interests any Ham. The other half is how well does it radiate
towards my intended listener?

This brings us to item 3 listed above. At the lower frequencies (below 2M band), you can well allow that you will obtain a lack-luster performance. This antenna design is suited for multiband operation which sacrifices gain opportunity to achieve it. This is the see-saw of antenna design - and you choose what is most important at the cost to the other issues.

Further to item 3 is the fact that above the 2M band this antenna might well seriously disappoint. This is a first-pass observation, but on close examination, you have selected an antenna that is actually two in one. Look closely at the two distinct sets of spoking elements. The lower flaring down are chosen for the lower band, the upper, more horizontal are chosen for higher bands - such as 2M and 440. The antenna has been optimized to recover from the see-saw of conflicting choice (we ALL want an antenna with universal coverage and maximum gain knowing we can not have both, and worse, we can barely expect half than less).

Still, even with this hail Mary pass, above 440 the antenna is going to be a very poor performer in getting signal out towards the horizon (where your listener might be), and instead put it up into the air (where no one is, except satellites, model rockets, and airplanes).

So, this being a brief discussion (some might argue otherwise), more is left to be said in response to all the questions it might provoke.

>Also, I thought this might make a good mobile antenna. But the instructions
>say don't use a magnetic mount. I'm really not interested in any kind of
>permanent mount. Why do they say not to use a magnetic mount?
>
>http://www.diamondantenna.net/d220.html

Wind force and moment arm. It is a LOT of wire in the air for highway speeds. Trust the instructions.

He is using a resonator to drive another radiater
(see constant impedance antenna system patent) The radiator that he
is driving is of multiple wavelength as in a wire mesh where the
multiple routes that can be taken by current flow provides an ultra
wide frequency span as the reactance changes become smaller and
smaller.
The final radiator is a full wave or more closed circuit version which
provides more gain than a fractional length over a ground plane

Very simple use of a metamaterial which has been demonstrated in most universities of the day.

24. ESD Protection ?

Newsgroup: rec.radio.amateur.antenna
Date: 2011-01-04 19:11:45 UTC
From: Bob <rgsros@notme.invalid>
Message-ID: <ifvrdm$e4l$1@news.eternal-september.org>
Source record: 6025

Hello,

Have a new WinRadio receiver, and am a bit concerned about protecting
it's front end from possible damage due to ESD ElectroStatic Discharge,
effects, etc.

I do receiving only, and have an end-fed PAR antenna outside, feeding
the receiver by about a 30 foot run of coax from the antenna.
At the antenna, I have an ICE lightning protector, and a copper bar as a
ground point, there.

No idea if the ICE unit has a bleed resistor for dissipating any static
buildups.

Too advanced in years now to build anything myself incorporating Zeners,
Varistors, or whatever, so would like to find, if you folks feel it's
worth doing (?), a small box unit with bnc's on both end, that would
provide good and safe ESD protection that I would locate indoors right
next to the radio's input.

Any thoughts or suggestions ?
Brand, Model Number, or just forget as probably not needed ?

BTW: Nice article on ESD at:
http://www.ce-mag.com/archive/01/Spring/Lee.html

Thanks,
Bob

Free electrons in a vacuum are nothing like a plasma.

Free electrons in a vacuum are nothing like metal.

What most folks do is put Back to Back diodes, across the 50 Ohm input,
and that clamps the antenna input to .7 Vac before the diodes conduct.
You may have to replace the diodes if you get a discharge, but not until.

Hi Richard,

Thanks for the detailed response. The Kenwood TH-F6A radio I intend to use
this antenna with is a handheld with 5W max output power. It is a 2m, 1.25m
and 70cm transceiver, with a separate wideband, all mode receiver built in
that has a capability from 0.1 - ~1300 MHz.

http://www.kenwoodusa.com/Communications/Amateur_Radio/Portables/TH-F6A

With that in mind, what is your opinion of the adequacy of this antenna?

>>Also, I thought this might make a good mobile antenna. But the

Thanks, I thought that might be the case. Again, keeping in mind the radio I intend to use, would this antenna be a good fit?

Hi Ron,

Generally speaking, the more functionality, the more tepid the
utility. However, as a 2m, 1.25m and 70cm transceiver paired with the
antenna you describe, you will have every opportunity to do quite
well. What could improve things? Raise the antenna higher! (No
matter how high it might be.) This is, after all, line-of-sight
operation. I can get into my buddy's 2M repeater 10 miles away, from
my basement with 125mW into an HT antenna; others that are closer have
to step out onto their back porch.

>With that in mind, what is your opinion of the adequacy of this antenna?

Above the 70cm band it is going to be deaf.

As I introduced my last response, this forum's best participation
comes through experimentation and construction. You could easily and
cheaply build your own 2m, 1.25m and 70cm transceiver antenna(s). The
difficult part may be in making them robust, or building something
similar as multi-band - nevertheless, building one that is adequate
takes no more than a simple SO-238 socket and five pieces of heavy
copper wire. A more elaborate one would have more wire and would
challenge you for insuring its robustness simply because you would
have to brace the extra wire in what is called a Discone Antenna
design.

The antenna you are contemplating is based on the Discone which is
notable for being multiband and very simple (although too many
websites mystify it - ask questions here).

Returning to the deafness above 70cm, this wavelength is verging on
being so small, that it would be a sin NOT to build your own antenna
for those high bands. This is something you can do at the kitchen
table in an evening during commercial breaks.

Hi Ron,

Antenna design has many variables with frequency (or its inverse with
wavelength) being key among them.

This means, of course, that you must first select the frequency or
band of frequency you want to work (or to listen to).

Second, you would want to set some goal for gain over an ordinary
dipole or monopole (a misnomer as all antennas are dipoler, but this
term is universally acknowledge to informally mean a vertical).
Perhaps a dipole or monopole (vertical) is enough to begin with.

Third, you want to select the polarization you intend to work (or
listen to). This is extremely important for VHF/UHF because its
line-of-sight path is very polarization sensitive. Verticals will
"see" verticals. Horizontals will "see" horizontals. Verticals and
Horizontals will be blind to each other. This is sort of mixing
metaphors where previously I used the term "deaf," it amounts to the
same thing: "cross polarized" signals will NOT WORK. In the VHF/UHF
bands, casual use is vertical polarization; however, for serious DXers
it is often horizontal and that activity is usually confined to DX
bands within the VHF/UHF. By casual use I mean simplex between you
and someone else locally, or contacts through repeaters for greater,
but still local range.

Fourth, height is key to "seeing." And, as you are entering into
experimentation, you want to erect some pole that will be both
securely fastened when erected, but also lowerable so that you can
attach your design and transmission line to it. Here again is the
see-saw nature of design. You will be raising and lowering this more

than once, so plan on it ahead.

Fifth, once you have the first four thought through (if not actually achieved) you should observe one quality about antenna design: it is scaleable. This means that if you find an antenna described on the internet that embodies all of the considerations listed above BUT it is in the wrong band, then there is a simple solution. An example will serve to illustrate.

Let's suppose you run across a Discone Antenna design on the internet (it satisfies your need for multiband application, let's say). However, the author of the design reveals how it was set up for HF operation between 60M and 10M (a very do-able design, if somewhat unwieldy in construction). Your interest is not in HF (suppose), but rather in VHF. What to do?

The antenna you are considering, but which is too large, is too large by 10 times. Scaleability in antenna design answers this with: change the existing design to 1/10th of all physical lengths and widths.

TA DA! A broadband antenna that works 6M to 220MHz with the characteristics of the original size. What was formerly an unwieldy size is now more manageable by virtue of scaling.

Just do it.

The same logic applies to more complex designs (and less complex ones, certainly) that you might see touted on the internet.

Finally - there is no reason to expect that anything you find on the internet actually works as the author of the page may describe. In fact, the higher the content of gushing and exhortation, accompanied with a laundry list of claims, will give every indication of someone being out to lunch. Check in here for sanity checks. This may inspire long discussions that ramble through many posters here (so far, none have been inspired to dip their oar in this thread). This is the nature of newsgroup activity that often focuses on minutia. However, from the bulk of response, you will get the general sense.

Well there's always thru-the-glass. It's not the most efficient in my experience (which is limited with respect to these) but it seems to work well enough if you have a decent repeater system that is the target. One plus is that you can usually get most of the half wave above the roofline.

For all around flexibility I still like the simple quarter wave vertical for 2m FM. Enough high angle for metro downtown use, but that involves either holes or magnets.

Richard is providing a lot more info than me, but the reality is this:
5 watts is not going to do all that great. Your mileage may vary, but
a lot of that power will be eaten up by feedline losses.

Also, bear in mind that a multi band antenna is generally a compromise
on every band it works on.

And finally, a hundred bucks plus shipping is a ripoff for that
antenna in terms of performance. On 2 meters, 220, and 440 a jpole you
could make out of old curtain rods or scrap conduit for ZERO will work
as well or better.

Also, if you make antennas...do not just clone something. 75% of jpole
projects start with copper tubing you have to purchase. Nothing wrong
with that, but the reality is anything metal you can make long enough
will likely work fine. Most people who publish web how to's on Jpole
antennas are copying old designs. Designs get set in the mud and dry
out to the point that noobs get a mindset that nothing else can work
on account of seeing so much of the same thing.

A hundred bucks would go a long way toward some high quality feedline.
Save the money and build an antenna.

Dave

Does the radio have any coils in the front end? Like the old-time radios, a primary coil between the antenna and chassis ground. If it has coils, there is NO way for static electricity to build up beyond millivolts, since all is at DC ground.

Diodes and other devices across the input are invitations for disaster. They ALL fail open circuit, leaving the device available for destruction by next charge.

If you put anything across the antenna input, use an RF choke. At least when it goes, you will smell smoke.

My main antenna is a 160 meter horizontal loop up 35 feet. Fed with 125 ft. of 600 ohm feed line. The feed line connects to the internal balun in an antenna tuner which keeps the shack end of the antenna at ground potential. If I disconnect the feed line during an active thunder storm, I can immediately draw an arc of at least 1/4 inch. So, I leave all hooked up unless I switch the feed line directly to the shack ground. I have never had an ESD problem coming via the antenna, and I don't think you will either.

unless the radio was shipped to you in a sealed esd protection bag and
had notes about what the esd handling requirements were, forget about
it and just plug it in and use it! ESD problems normally only apply
to bare integrated circuit leads and things connected to them like
pins on a card plugging into a computer motherboard. anything on an
external connector like where you would connect power and antennas
should already have sufficient protection for normal use.

RG-213 and RG-8 (both of which standards are actually obsolete, so you're buying RG-213 "type" cables) are basically the same.. roughly 0.4" in diameter, solid polyethylene dielectric, AWG13 inner conductor.

RG-8X is a smaller diameter foam dielectric cable which will have higher loss (because the conductors are physically smaller, so IR losses are higher).

There are tons and tons of other cables that may be better or worse for your application.

Are you looking for something for VHF and up? In that case, the foam dielectrics tend to be lower loss than the solid dielectric. foam dielectric 75 ohm coax (as used in cable TV systems) is pretty good from a loss standpoint at VHF and UHF, although you need to check the exact type (there are some pretty bad 75 ohm coaxes out there, too).

Do you care about exposure to the elements?
Does it need to be flexible?

Are you transmitting through it (e.g. is power handling important?)

Then of the three I mentioned, the RG-8/U would be best?

Yes, I am mostly interested in 2m, 1.25m, amd 70cm at the moment. Most
cables I've seen - in my admittedly brief exposure - have been 50 ohm.
Wouldn't 75 ohm cause more loss?

> Do you care about exposure to the elements?

Yes, as it will be running from a roof antenna to the house. It is on the
north side of the building though, so the majority of it would not be
exposed to the sun.

> Does it need to be flexible?

Somewhat. Once in place it won't be moved around much, if at all.

> Are you transmitting through it (e.g. is power handling important?)

I hope to be ;-) I'm taking the Technician Class test Saturday! As for power
handling, all I have at the moment is a 5 watt max handheld. I am interested
in building a 50-100 watt power amp for it, though. You wouldn't happen to
know where I could find a schematic for such an animal, would you? Thanks so
much for your reply Jim!

I think you have completely lost sight of what you are doing. The radio in question is a handheld device, aka a "Handie-Talkie" or H/T. It is designed to work with the whip antenna that comes with it.

It may not get better reception or transmission with a larger antenna, and may actually do worse. The front end of the radio is not designed to handle large signals and it could easily overload and hear nothing.

Obvioulsy an outside antenna is needed if you are inside metal or poured concrete (due to the steel reinforcing bars) walls or in a car. In a wooden or plasterboard house, you may not get a lot of improvement nor need it.

You might think that a high gain antenna will improve your reception, but if there is a close station or repeater it will just blank out. It does not have to a ham transmitter, paging, VHF (fire/EMS, etc) will wipe out 2m, and UHF can disappear under a GMRS or land mobile system.

If you live out in the woods, then a decent outside antenna will help and a random wire or dipole will help with HF reception. In a big city, the ferrite bar (up to 7mHz) will be a noise magnet and you many not even be able to receive anything at all.

As for coax, good quality RG-6 coax will do fine, and you can get it almost anywhere. Make sure to use high quality COMPRESSION connectors and adaptors. The radio uses an SMA connector so you will need to get an SMA to F to connect it to the coax and the antenna will have a PL-259 (aka UHF) or "N" connector on it so you will need to get the connectors from a specialty shop.

You also want to get an external speaker and microphone as if you connect up a coax to it, you will destroy the radio. The stress on the antenna connector will cause it to break, or crack the circuit board it is connected to. If you epxect to hand hold the radio and talk on it, something stiff such as RG/213 may not last out a day of activity. :-(

I saw a note from a guy who "cooked" part of his window with the thru-
the-glass approach. He said the film sandwiched in the safety glass
darkened from being heated. As I recall, he was using 50 watts.

This stuff is all trade-offs, eh?

Amen!

I love to build antennas and I could not do it without some form of measurement device to determine the characteristics of the in-work project. I usually go by VSWR and alter the design in various ways (often slight changes to element lengths) to minimize the VSWR at my chosen freq. a VHF/UHF VSWR meter can be had for peanuts but a 250-dollar antenna analyzer will be in your future if you get a case of Antenna Fever. (Yeah, I have one.) However, as you are just getting started, try reading this: http://kb6nu.com/no-vhf-swr-meter-no-problem/

I like working in copper pipe at VHF and above. It's very durable and responds well to a Home Depot propane torch for so-called "sweat soldering." Copper pipe comes in several grades. The cheapest grade seems to make antennas that are just fine.

Welcome to the hobby.

I always "pigtail" fat, stiff antenna cables if I'm using them on an HT. A pigtail is a short length of a small. lightweight cable that's sufficiently flexible to put no great strain on the HT connector. Since it's short, you don't lose significant signals. Some folks will claim that losses in the extra connectors and adapters are a big problem. Nope, not if they're properly made and installed.

45. Understanding Parallel to Series conversion

Newsgroup: rec.radio.amateur.antenna
Date: 2011-01-13 17:05:38 UTC
From: amdx <amdx@knology.net>
Message-ID: <401b3$4d2f3097$18ec6dd7$1455@KNOLOGY.NET>
Source record: 6046
Cross-posted to: rec.radio.amateur.antenna,sci.electronics.design

Hi All,
Please look at this in fixed font.
I'm looking for understanding of a series to parallel conversion for
antenna matching.
I'm pretty sure I'm missing something, so point it out to me.
This is in regard to a crystal radio, so the match is for a low impedance
antenna to a high impedance tank circuit.
The antenna: R=58 ohms C=1072 ohms at 1Mhz.
The tank: L=240uh C=106pf Q = 1000
Tank Z =~1.5 Mohms
Here's my understanding of what I think I'm reading.
I put a matching capacitor in series with the antenna.
Antenna--> -----R-----C--------Match cap-----tank------ground.
and this is supposed to transform the circuit to this.
(Maybe better said, equivalent to this)

```
l------------l
l l
Antenna---> R C LC<---Tank
l l
l------------l
^
Ground
```

I calculate an 18.5pf cap for the match, making the antenna look like 58R
and 17pf.

So this; Antenna--> -----58R-----270pf--------Match
cap18.5pf-----1.5Mohms------ground.
This converts to;

```
l-----------------l
l l
Antenna--->58R 17pf 1.5M<---LC Tank at
l l Resonance
l-----------------l
^
Ground
```

And I now have a 1.5 Mohms source feeding a 1.5 Mohm load.
The purpose of which is to cause minimal loading of the tank by the antenna.
I don't understand how adding a series capacitor makes a parallel
conversion.
What do I misunderstand or do just need to believe the numbers.
Thanks, Mikek

Hi Mike,

Is this a fantasy antenna?

For the 58 Ohm resistive value, it would have to be about 300 feet
tall - not the size of operation one usually comes to expect for a
Xtal radio aficionado.

If it is that tall, it would exhibit 200 Ohms Inductive reactance (one
fifth of what you report, and the opposite sign).

Something doesn't wash here.

>I calculate an 18.5pf cap for the match, making the antenna look like 58R
>and 17pf.

58ï¿½j17 Ohms is still a complex impedance, and says nothing of match
which can only be expressed in terms of the expected load R.

>And I now have a 1.5 Mohms source feeding a 1.5 Mohm load.

How that is arrived at is something of a mystery. By the numbers, you
describe a 26000:1 mismatch.

>The purpose of which is to cause minimal loading of the tank by the antenna.

Well, what you have described is sufficient mismatch to insure that.
The English reading of your sentence also is instructive: the tank is
isolated from the antenna, i.e. no signal is passed to it. This seems
to be counterproductive in regards to detection.

> I don't understand how adding a series capacitor makes a parallel

Perhaps it's a longwire antenna, of crappy wire, parallel to
the ground?

It's an example from an article, I don't like the number either, seems like
maybe
2 to 12 ohms would be more realistic. I think the capacitance is ok.

Ok, how about just working with the concept.

>>I calculate an 18.5pf cap for the match, making the antenna look like 58R
>>and 17pf.
>
> 58j17 Ohms is still a complex impedance, and says nothing of match
> which can only be expressed in terms of the expected load R.

Sorry, I missed a math step, the R was converted to 1.5M.
see formula below.

>>And I now have a 1.5 Mohms source feeding a 1.5 Mohm load.

> How that is arrived at is something of a mystery. By the numbers, you
> describe a 26000:1 mismatch.

Here's what is stated in the article:
" The concept is that at any given frequency, a parallel RC network has an
equivalent
series RC network, and vise versa. We can use this property to transform the

real component
of an impedance to a much higher or lower value.
As long as Xc series >> R series.
Xc (parallel) = Xc (series)
R (parallel) = XC^2 (series) / R (series)
The Xc of a 17pf at 1Mhz is 9368 Ohms.
To rewrite Rp= 9368^2 / R = 1.513 Mohms

The article then goes on to say,
The utility of this equivalence can be seen by choosing a sufficiently small
value of C series
(a large Xc series) A "small" resistance can then be transformed into a
"large" value.

>>The purpose of which is to cause minimal loading of the tank by the
>>antenna.

>   Thanks, Mikek

Seems like it doesn't much matter whether the antenna is real or imagined; the point is rather what's going on when you couple a low impedance source to a parallel-resonant tank through a small capacitance...

Perhaps it will help you to think first about a low impedance source, let's say 50 ohms at 1.591MHz (1e7 radians/sec), that you want to couple to an (imaginary) inductor, 2.5mH with Qu=500 at that frequency, and maximize the energy transfer to the inductor. The inductance and Q implies that the effective series resistance of the inductor is 50 ohms. That means all we need to do is cancel out the inductive reactance, and we can do that with a series capacitance--that happens to be 4pF. That assumes the ESR of the capacitance is zero, or essentially zero.

But what if the inductor has 1/4 as much inductance, 0.625mH, same Qu? Then its effective series resistance is 1/4 as much, or 12.5 ohms, and to get the same energy dissipated in it, you need the current through it to be 2 times as large as before (constant R*I^2). The total capacitance to resonate the tank is 4 times as much: 16pF. If you divide that into two 8pF caps, one directly across the inductor and the other in series with the 50 ohm source, (very close to) half the tank's circulating current flows in each capacitor. For the same energy delivered to the coil, the voltage at the top of the inductor must be half as much as before. Since the coupling capacitor to the source is twice as large as it was before, the load impedance the source sees must be the same as before (50 ohms, as required for max energy transfer).

Carry that another step, to an inductor with 1/16 the original inductance and the same Qu=500, and you need 64pF to resonate it and 16pF to couple to it from the low impedance source. Now you divide up the total capacitance with 3/4 of it (48pF) directly across the inductor and 1/4 of it to the source. 3/4 of the tank's circulating current flows in the 48pF capacitor, and 1/4 of it in the 16pF to the source; the source once again sees a 50 ohm load (because the voltage at the top of the inductor is 1/4 of the original, and the capacitor coupling to the source is 4 times as large -- with the current in the source unchanged).

The key to understanding this coupling, to me, is the division of the tank's circulating current between the two capacitances, one directly across the coil and one in series with the source. The smaller the inductance (at constant Q), the more circulating current required for the same energy dissipation, and the smaller _percentage_of_total_resonating_capacitance_ for coupling to the (constant impedance) source.

Cheers,
Tom

At resonance, the LC tank disappears and you are left with a 1.5 Meg equivalent of the tank losses.

Adding a small capacitance in series with your antenna gives you, effectively, an antenna that looks like a 58R in series with a 17 pF capacitor.

So now your circuit looks like:

```
58R---17pF-----|
|
1.5M
|
|
----
GND
```

I don't see any conversion at all.

John

Ah! After studying this for a while, I think I understand what you are driving at.

Convert series 58R and 17 pF to a parallel equivalent. That is, take the reciprocal of Z = 58 - 9368j to get Y = 661e-9 + 106.8e-6.

Now, what is the reciprocal of the real part of Y? That's 1/661e-9 or about 1.5 Meg. So, the real part of the parallel equivalent now looks like the resistance you are interested in.

Does this help?

Cheers,
John

Hi Greg,

No, that would more likely result in a characteristic Z of 600 Ohms.
If by being close to ground you mean the 58 Ohms finds itself invested
in the dirt, well, yes that might be the case.

The long and short of it means that to investigate the problems of an
antenna "loading" a tank coil means that you really must understand
the antenna - not a simple thing as this thread will undoubtedly
reveal.

Hi Mike,

Then your intuition is firing on all cylinders, great.

>Here's what is stated in the article:
> " The concept is that at any given frequency, a parallel RC network has an
>equivalent
>series RC network, and vise versa.

This is classically true. The frill of "at any given frequency" can
be discarded.

>We can use this property to transform the
>real component
>of an impedance to a much higher or lower value.

This concept is not a "property," however; more a transformation (as
should be apparent in the original statement). In other words
concept
equivalent
property
transform
use four words to describe one thing - transform (plain and simple).

>As long as Xc series >> R series.
>Xc (parallel) = Xc (series)
>R (parallel) = XC^2 (series) / R (series)

> The Xc of a 17pf at 1Mhz is 9368 Ohms.
>To rewrite Rp= 9368^2 / R = 1.513 Mohms

Well, what looks like hand-waving is probably close to the numbers one could expect.

>The article then goes on to say,
>The utility of this equivalence can be seen by choosing a sufficiently small
>value of C series
>(a large Xc series) A "small" resistance can then be transformed into a
>"large" value.

The reason why I say hand-waving (and this is probably your gut reaction as to "why") is that the five lines of operations you quote starts with a presumed requirement and then proves it has been met.

What happens if Xc series << R series?
What happens if Xc series < R series?
What happens if Xc series = R series?
What happens if Xc series > R series?

This somewhat clouds the mystery for you of understanding Parallel to Series conversion. I wonder too. Are we dropping in a new component and stepping back with a wave and Voila! to find the Parallel circuit has suddenly been transformed? Yeah, that WOULD be a mystery.

And what is this Xc(parallel) and Xc(series) stuff?

Xc is stricty a function of pi, capacitance, and frequency.

And what is this R(parallel) and R(series) stuff?

R is a function of its, well, resistance. No variables to be found.

No doubt there is more to be extracted from this article.

Upon review of other correspondents to your plight, ditch the article
and pick up an EE sophomore book on circuit analysis. The coverage
should be encompassed in the section (from my own copy) called
"Transform Driving Point Impedance and Admittance (Immittance)."

The article's focus is on matching a crystal radio tank to the antenna,
So as a general statement, the tank is a high impedance (mostly R)
and the antenna has a low R and a C in the 100's of ohms.
So I don't know, is that (>>) ? The question is retorical in nature.

> And what is this Xc(parallel) and Xc(series) stuff?

I took a little liberty there, The article had a schematic diagram showing
a series RC, then the radio showing the Parallel equivalent antenna
connected.
The the actual labels were Xs, Xp, Rs, and Rp.
Sorry if I muddied it, the attempt was to make it clearer.

Seems like it doesn't much matter whether the antenna is real or imagined; the point is rather what's going on when you couple a low impedance source to a parallel-resonant tank through a small capacitance...

Perhaps it will help you to think first about a low impedance source, let's say 50 ohms at 1.591MHz (1e7 radians/sec), that you want to couple to an (imaginary) inductor, 2.5mH with Qu=500 at that frequency, and maximize the energy transfer to the inductor. The inductance and Q implies that the effective series resistance of the inductor is 50 ohms. That means all we need to do is cancel out the inductive reactance, and we can do that with a series capacitance--that happens to be 4pF. That assumes the ESR of the capacitance is zero, or essentially zero.

But what if the inductor has 1/4 as much inductance, 0.625mH, same Qu? Then its effective series resistance is 1/4 as much, or 12.5 ohms, and to get the same energy dissipated in it, you need the current through it to be 2 times as large as before (constant R*I^2). The total capacitance to resonate the tank is 4 times as much: 16pF. If you divide that into two 8pF caps, one directly across the inductor and the other in series with the 50 ohm source, (very close to) half the tank's circulating current flows in each capacitor. For the same energy delivered to the coil, the voltage at the top of the inductor must be half as much as before. Since the coupling capacitor to the source is twice as large as it was before, the load impedance the source sees must be the same as before (50 ohms, as required for max energy transfer).

Carry that another step, to an inductor with 1/16 the original inductance and the same Qu=500, and you need 64pF to resonate it and 16pF to couple to it from the low impedance source. Now you divide up the total capacitance with 3/4 of it (48pF) directly across the inductor and 1/4 of it to the source. 3/4 of the tank's circulating current flows in the 48pF capacitor, and 1/4 of it in the 16pF to the source; the source once again sees a 50 ohm load (because the voltage at the top of the inductor is 1/4 of the original, and the capacitor coupling to the source is 4 times as large -- with the current in the source unchanged).

The key to understanding this coupling, to me, is the division of the tank's circulating current between the two capacitances, one directly across the coil and one in series with the source. The smaller the inductance (at constant Q), the more circulating current required for the same energy dissipation, and the smaller _percentage_of_total_resonating_capacitance_ for coupling to the

(constant impedance) source.

Cheers,
Tom

Tom I need to print this out and work with it.
Did you change the inductor on purpose or just miss a
factor of ten from the numbers I posted?
Thanks, Mikek

Hi Jake,

Sounds like the two Sonys are being overwhelmed by a strong local
station. They have no front-end tuning to make them as selective as
your, as you describe, analog tuned clock radio.

Mikek,

on of the main problem of this newsgroup is that people write answers without carefully reading the question.

Everyone tends to "convert" the question toward issues he is able to write something about, Unfortunately those issues often have little to do with the original question.

I am offering you my answer, which may be clear, so and.so, or hardly understandable ... I do not know. But be sure that at least I paid maximum efforts to appreciate your question (though my numbers do not always match yours). I'll try to explain the issue in the easiest way I can, assumimng that all components behave in an ideal manner.

Let us first resume your hypotheses:

- the antenna has an impedance equal to the SERIES of a 58-ohm resistance and a capacitive reactance of -1,072 ohms which, at 1 MHz, corresponds to a 148.5-pF capacitance
- your aim is to transform that complex impedance into a 1.5-Mohm purely-resistive impedance, that would match that of your tank circuit.

That said, you must first appreciate that your antenna can be visualized in two ways:

- as the SERIES of R=58ohm, C=148.5pF (as said above)
- or, by applying the series-to-parallel transformation formula, as the PARALLEL of R=19,862ohm, C=148.1pF

These are just two fully equivalent ways of describing the same physical antenna. You can freely use the one which suits you best. For our purposes let us here visualize your antenna as the parallel of R=19,862ohm, C=148.1pF.

That said, assume for a moment that you are able to eliminate in some way (i'll tell you after how) the 148.1-pF parallel capacitance. What would then remain is a 19,862-ohm resistance, a value which unfortunately does not match the 1.5-Mohm figure you wish to get.

So, how to get just 1.5Mohm instead?

Playing with the transformation formulas you would realize that, if the SERIES representation of your antenna would hypothetically be R=58 ohm, C=54 pF (instead of R=58 ohm, C=148.5 pF as it is in the reality), the corresponding PARALLEL representation would then become R=1.5Mohm, C=53.9 pF. Just the resistance value you wish to get!

But modifying the SERIES representation of your antenna according to your needs is very easy: if you put an 85-pF capacitance in series with the antenna, its total capacitance would change from C=148.1 pF to C=54pf. And the antenna SERIES representation would then become R=58 ohm, C=54 pF, as you were aiming at.

Once you have put such 85-pF capacitance in series with your antenna, its PARALLEL representation becomes R=1.5 MHohm, C=53.9 pF, as said earlier.

For removing the 53.9-pF residual parallel capacitance, just resonate it with a 470-uH parallel inductance. The trick is then done: what remains is just the 1.5-Mohm resistance you wanted to get!

In summary:
- put a 85-pF in series (i.e. in between your antenna and the tank circuit)
- put a 470uH inductance in parallel to the tank (in practice this just means to increase the tank inductance by 470uH with respect to its nominal value).

Hi Mike,

There's your first mistake. Tank Z is never, ever "mostly R," or you wouldn't be able to make the Q claim of 1000 (or even 10).

Please note the distinction between Z (which includes R) and R in isolation. Further, read Terman's material on Tank Circuits in his classic "Electronic and Radio Engineering" to clear up the clouds that obscure the view of their design rationale.

>and the antenna has a low R and a C in the 100's of ohms.

This is the sad (and useful) fate of short antennas, yes.

> So I don't know, is that (>>) ? The question is retorical in nature.

It is usually rhetorical, yes, insofar as not being enumerated. Often in technology it is a shorthand for a 10:1 ratio. Perhaps 100:1.

>> And what is this Xc(parallel) and Xc(series) stuff?
>
> I took a little liberty there, The article had a schematic diagram showing
>a series RC, then the radio showing the Parallel equivalent antenna
>connected.
>The the actual labels were Xs, Xp, Rs, and Rp.
> Sorry if I muddied it, the attempt was to make it clearer.

I could follow Xc(parallel/series) easily enough, but what you neglected to mention was there are two schematics embodied in the single one you brought to the discussion.

Making questions simpler often leads to Byzantine answers.

Another problem in this simplification is that there is more than one agenda being served, and they sometimes conflict with any single solution. As often happens, when I ask "What do you really want?" I get a response, I offer a solution, and I am immediately rebuffed that it does not serve the other agenda - which, then leads me to ask "What do you really want?"

Hi Tony,

Great walk-through, excellent solution. And the appearance of Two
additional, unstated components. Are they found in the original text
of the article? Possibly not and thus the source of mystery (and a
cautionary tale about what might be found as knowledge on the
Internet).

Mike, I don't care what your values are. I'm interested in showing
you in the generalized _concept_: how it works. Once you understand
that, you can work with whatever component values you want. If you
want to actually build something that works, you better pick values
you can realize.

Cheers,
Tom

Never heard of that before, and I know lots of people who've used them
over the 30+ year period they've been around. Including myself. I'd
like to see pictures. And also know how much power the guy was sending
to an antenna system rated for a specific number of watts.

Ok, Richard that wasn't clear to me, I think at resonance the tank is
all R, but I put mostly R because I figured you would have an objection to
all R. So are you saying it is pure R at resonance?

>......which, then leads me to ask

>"What do you really want?"

I want to understand the use of an air variable to match an antenna
to the tank of a crystal radio, over the AMBCB frequency range.
With that, I found I need to understand the series to parallel conversion,
which I now understand, just IS, it's not anything you do. A series RC has
a parallel RC equivalent.
I'm not sure how it can be both at the same time. But as long as that R is
transformed up, and minimally loads my tank, that's all good.
Then, I understand I still have C left that I can use as part of the C for
resonating my LC tank.

Sorry, how much power the system was _rated_ for. You stated 50 watts
delivered. Also whether he installed it correctly and tuned it correctly.

You've got it now, Mike. The series/parallel equivalent circuits are
just a mathematical tool for putting things in a form you can handle
easier. Adding the capacitor does not change the circuit from series to
parallel or the other way around.

Lets say you have a fixed frequency AC source, a resistor, and a
capacitor. The R and C is in a box where you can't see how they are

wired. You measure the voltage applied to the box and measure the current (with phase) into the box.

You could calculate the value of the R and C, right? Most people would calculate them as an R in series with a C. But, there is a parallel R (of a different value from the series case) and a parallel C (of a different value) which will give the same measurements as the series case. You cannot tell which way they are wired internally and, because of this, you cannot tell the actual values of the components. But, for analysis or synthesis, it won't matter.

You can mathematically change a circuit around from series (impedance) to parallel (admittance). This is the conversion that you've been hung up on.

Does this make any sense?

Cheers,
John

Ya, I have a better understanding now. I need to run a few cases and
see the minimum and maximum capacitor needed for a proposed situation.
I wish it would warm up, I'd like to put up an antenna and measure it, to
get a real case to work with.

> A series RC has
>a parallel RC equivalent.

>I'm not sure how it can be both at the same time.

What I found to be most instructive, in understanding this (that is, series representations vs. parallel representations) was to drop down a level into the underlying mathematics.

Start with the fact that you have two impedances (let's call them Z1 and Z2) which are in parallel.

Toss in the basic formula for the result:

Ztot = (Z1 * Z2) / (Z1 + Z2)

Since you have a resistor R and a capacitor C in parallel, Z1 is a real number (it's just R), and Z2 will be an imaginary number (it's -i/2piFC, or 1/jWC if you prefer engineering notations and squint at the "W" so it looks like an omega).

Plug these values into the equation above, and simplify according to the rules for complex number mathematics. You'll end up with Ztot being a complex number, equal to the sum of a pure resistance (real) and a pure capacitance (imaginary). These are the impedances of the series network equivalent to your original parallel network.

Alternate route to the same solution: take each of the two impedances and invert them, to determine the admittances of the two components. The admittance of R will be purely real, while the admittance of C will be purely imaginary. Add the two together (since they're in parallel) to get the complex admittance of the parallel combination. Now, invert this complex number according to the usual rules, to get the equivalent complex impedance... this will be a complex number, the sum of a pure resistance and a pure capacitance. The numbers you get will be the same as in the previous work-through.

Mike -

Look into getting and learning (free) LTSpice for circuit analysis.

Also look into getting and learning EZNEC (free) for antenna analysis.

You can't beat putting up an antenna and building a circuit for it and measuring results. But, during adverse weather, you can experiment with simulation software and learn a lot. Then you can try your simulated experiments when the wx is good.

Cheers,
John

Thank you for the excellent suggestions, Geoff! I live in the boonies - the nearest repeater is about 15 miles away and no line of sight with it - at least not at ground level. All of the others are considerably farther away and no line of sight with them, either (lots of mountains here). I already have a short SMA adapter cable for my mobile antenna, and a speaker/mic too.

Amen!

I love to build antennas and I could not do it without some form of measurement device to determine the characteristics of the in-work project. I usually go by VSWR and alter the design in various ways (often slight changes to element lengths) to minimize the VSWR at my chosen freq. a VHF/UHF VSWR meter can be had for peanuts but a 250-dollar antenna analyzer will be in your future if you get a case of Antenna Fever. (Yeah, I have one.) However, as you are just getting started, try reading this: http://kb6nu.com/no-vhf-swr-meter-no-problem/

I like working in copper pipe at VHF and above. It's very durable and responds well to a Home Depot propane torch for so-called "sweat soldering." Copper pipe comes in several grades. The cheapest grade seems to make antennas that are just fine.

Welcome to the hobby.

Sorry, too, that this was years ago and I cannot recall the source. I looked for something (anything) before I posted, came up with nothing and almost didn't post it. More looking just now, trying different search terms and still nothing. Maybe it was BS. One lone story isn't very impressive.

>all R. So are you saying it is pure R at resonance?

Hi Mike,

Let's say there is absolutely no loss in the Tank (superconduction and perfect dissipation values as it were); then we would have to ask ourselves what happens to energy applied to this Tank at resonance? It can never enter it, thus the Tank is, in effect, infinite in resistance. But what about the circulating currents? The Tank is, in effect, infinite in conductance.

Infinite Ohms & Zero Ohms simultaneously.

Is this the Z of the Tank? Is this the R of the Tank to which you are matching? No, not even close and certainly it has nothing to do with resonance - except the condition is a function of it being at resonance. A low Z Tank or a high Z Tank each evidences the same Infinite Ohms & Zero Ohms simultaneity given my initial condition of absolute losslessness.

For the energy being applied to or drawn from the Tank, the Tank is in parallel operation. For energy in the Tank, the Tank is in series operation. Where is the Q in this duality? Q suffers by the nature of what you call R. Q has two different values by this duality. One is called "Loaded Q" and as you might guess, the second is called "Unloaded Q." Consult Terman for the engineering design rationale for optimal Qs as I suggested.

When the discussion of "matching" seeks to employ R (pure resistance), then the next step is toward a conjugate match and elaborations of efficiency and maximum transfer of power. There is also an alternative discussion called the Zo Match. This second match seems to invite the same elaborations (many who post here try to force them both into the same salad bowl and cover the illogic with dressing).

When you offered the comment about "the tank is a high impedance (mostly R)" it was steering the car off the cliff. Is this a Zo match or a Conjugate match you are seeking? (I can already anticipate this has gone over your head, as well as many readers. This and the questions that follow are rhetorical.)

For instance, and returning to antennas (the purpose of this group's discussion focus), you can have very high Z antennas with very low resistance characteristics. Do you want a Zo Match, or a Conjugate Match? Let me flip the antenna: you can have very high Z antennas with very high resistance characteristics. Do you want a Zo Match, or a Conjugate Match? Let's do this sideways: you can have very low Z antennas with very low resistance characteristics. Do you want a Zo Match, or a Conjugate Match? I could box the compass here, but the I think I will let the reader off.

John had some number issues with Tony's explanation, but the gist of Tony's rational treatment should be your lesson as it provides for your requested "why." It also implies (by my comments of the sudden appearance of two new components) that our (Ham) tuners have been designed to introduce the proper amounts of reactances in the proper parallel/series relationships to enable the necessary transform towards optimal Q and loading balance. The most elaborate of tuners can change from Pi to T topologies, or series L parallel C (or series C parallel L), or series LC, or parallel LC, or parallel C series L (or parallel L series C)... and any of the other combinations I have

not enumerated (about 9 in all). Each shines for a particular situation - you have named only one.

It is not a trivial discussion by any means even when we are talking about the addition of only two new components. So, your obtaining an understanding is not going to be achieved at one sitting in front of the "definitive" posting to a thread.

One problem of seeking the "definitive" posting is that it cannot be born from a broken premise that article you were trying to figure out is lame in the extreme. Given everything you have revealed about it, it didn't present a solution to its fantasy antenna. That is why this work of fiction is not understandable.

just throw a wire out the window, plug it in, and see if it works!
ANY antenna connected with a hunk of hookup wire will work better than
NO antenna with a perfectly designed match!

A lot there, but I didn't get anything out of it.
At resonance, does the tank look capacitive, inductive, resistive, or all
>>to the antenna<< you connect to it. (this makes the assumption attaching
the antenna didn't change anything, it did, let's say I adjusted back to
resonance)
And then my original question,
Are you saying it is pure R at resonance?
A yes or no will be fine, then I can try to reprocess the above that
didn't get anything out of.

I'll bite,
I want maximum transfer of power, I'm still working with the tank as
a large pure R so I want the antenna to look like the same large R.
I realize there is still capacitance from the antenna to deal with.
Now are getting to conjugate :-)

Because of the wavelength of the BCB antennas are usually short and
capacitive,
so simple tuning with a single series cap works. The problem begins when you
tune to the high end of the band and you have to much capacitance to get to
resonance with your tank. Then the inductor can be added parallel to the
series
antenna tuning cap. Alternately and you could increase the tank inductor
size.

I didn't rewrite the whole article here, there was a solution
with three equations, that, using the antenna finds the L with the
constrants
of highest operating frequency and lowest capacitance of your capacitor,

then a program is run that finds values for C (antenna) and C (tank) and
I'm not ready to go here yet C (load), he also tunes the diode/earphone
load for optimum with yet another capacitor.
The funs over for now go to get ready for work,
Thanks, Mikek
PS, he runs the program with another, what you call fantasy antenna,
and I agree...

No you don't.

What you want is the lightest final load sufficient to drive a speaker
for a detectable sound matched to the Tank such that it does not
degrade its Q which in turn is the highest possible value for
supporting the largest amount of signal from the antenna at hand.

Am I wrong?

We haven't got to the load yet! it's coming :-)

> for a detectable sound matched to the Tank such that it does not

> supporting the largest amount of signal from the antenna at hand.
>
> Am I wrong?

There is a chance the Q (loaded) will be high enough to limit audio
bandwidth.
So (I think) we couple more energy into the tank for more signal and this
would
lower Q for a wider bandwidth.

Here's a question I have brewing.

I have three circuits to put together, a source, a tank and, a load.
I have two scenerios. hmm..seems as though I have three!
For now assume they are all resistive.
These are all set up for maximum power transfer, just in different order.

Scenerio 1.
Let's say the tank is 1 megohm.
I drive the tank with a 1meg source, so now I have 500Kohm circuit
impedance.
Then I load this with 500Kohm load.
So..
The 1 megohm tank is loaded with 333,333ohms, 1meg//500k
The 1 meg antenna is loaded with 333,333ohms, 1meg//500k
The 500Kohm load is drive by 500kohms. 1meg//1meg

Scenerio 2.
1 megohm tank.
I put a 1 megohm load

I can drive the tank with a 500Kohm source,
So..
The 1 megohm tank is loaded with 333,333ohms, 500k//1meg
The 500 Kohm antenna is loaded with 500Kohms, 1meg//1meg
The 1 megohm load is driven by 500kohms. 1meg//500k

Scenerio 3.
1 megohm tankThe
I drive the tank with 2 megohm source and load it with a 2 megohm load.
So..
The 1 megohm tank is loaded with 1 Mohm, 2Mohm//2Mohm
The 2 meg antenna is loaded with 666,666 ohms, 1meg//2meg
2 megohm load is drive by 666,666 ohms. 1meg//2meg

I have no clue where maximum power is delivered
from the antenna to the load.

This aught to be fun :-)

Hi John,

I do not understand where your -2947j figure comes from. I see it appearing nowhere in my calculations.

The antenna mentioned by Mikek has an impedance of 58R-1,072j which, according to my spreadsheet, corresponds (at 1 MHz) to the parallel of 19862R and -1075j (that is a 148,1 pF capacitor).

In any case, parallel <--> series trasformations never result in a change of the reactance sign; therefore it is not possible that a -2957j (negative) reactance is transformed into a +2948j (positive) reactance.

Well, it's not mine and it appears in you post as 54 pF. Isn't 58R in series with 54 pF equal to 58-2947j? And isn't the parallel equivalent of that equal to 149k ohms of resistance in parallel with -2948 ohms of reactance (~54 pF)?

I'm pointing out that you slipped a decimal point or you would have seen that 54 pF is too much it results in the parallel equivalent resistance of 149k rather than 1.49M. Mike's figure of about 18 pF (17 pF series combination) will do the job.

You are correct. I allowed the sign of the suseptance to creep through.

Does anyone have any idea where I can obtain a replacement antenna for
an obsolete Icom ICA20 air band hand held radio, I've made a couple
myself but they're not cosmetically brilliant (!) The IA20 bit
might not mean a lot in the "States" but the rig covers the VOR band,
and then 118 - 136 MHz AM.
The termination is BNC.

Thankx guys

Phil

Yes, at one o' clock in the morning, I slipped the decimal point. So, the total antenna series capacitance should have been about 17 pF, not 54 pF. This requires putting a 19-pF capacitance in series with the antenna, not 85 pF.

And the inductance resonating the residual parallel capacitance becomes 1,490 uH instead of 470 uH.

Sorry for mistake!

Actually, that remains to be seen. We must first establish that we
have the same available power in all three which I will give the
arbitrary value of 1 to simplify the math. Also, you mix your source
loading in these models, so in the sense of Norton/Thevenin sources I
describe the power being supplied by a parallel current source to keep
the units uniform.

>Scenerio 1.
>Let's say the tank is 1 megohm.
>I drive the tank with a 1meg source, so now I have 500Kohm circuit
>impedance.
This presumes a parallel current source by your description of the
input and tank appearing as a 500K circuit. This is why set the
initial condition of there being a current source for all scenarios.
>Then I load this with 500Kohm load.
The parallel current source then sees 250K Ohm for the same power
available to all scenarios.
Pavailable = 1 = iï¿½ï¿½250K
i = sqrt(1/250K)
As the current does not divide evenly, then we will work to find the
power to the load through voltage sharing. Obviously, there is the
same voltage across the three components, hence:
e = iï¿½250K = 500
Pload = eï¿½/500K = 0.50

>Scenerio 2.
>1 megohm tank.

>I put a 1 megohm load
>I can drive the tank with a 500Kohm source,
This does not qualify either a parallel current nor series voltage
source, but as both are fungible to design with the same value
resistance, then I will proceed as before with all three resistors in
parallel to a parallel current source:
Pavailable = 1 = iï¿½ï¿½250K
i = sqrt(1/250K)
Obviously, there is the same voltage across the three components,
hence:
e = iï¿½250K = 500
Pload = eï¿½/1000K = 0.25

>Scenerio 3.
>1 megohm tankThe
>I drive the tank with 2 megohm source and load it with a 2 megohm load.
>So..
This does not qualify either a parallel current nor series voltage
source, but as both are fungible to design with the same value
resistance, then I will proceed as before with all three resistors in
parallel to a parallel current source:
Pavailable = 1 = iï¿½ï¿½500K
i = sqrt(1/500K)
Obviously, there is the same voltage across the three components,
hence:
e = iï¿½500K = 707
Pload = eï¿½/2000K = 0.25

>I have no clue where maximum power is delivered
>from the antenna to the load.

Any clues now? Barring any math or conceptual error on my part, then
by one account more power (that is one measure of success) is
delivered to the load when its resistance is lowest.

How does this impact design priorities?

My thought was, if we couple more energy from the antenna, it loads
the tank more lowering Q. The thought might need more work....

Scenerio 1 is how I have always thought about the system.
Nice to know where max power transfer is.

> How does this impact design priorities?

I'm still at design highest Q tank circuit then transform antenna
to match Z of tank. That's about as I want to go for now.
Not ready to get into that diode thing again.

Unless you've been studying :-)
running for cover.....
Thanks, Mikek

Well, that is nominally considered as "matching" in that the coupling
from the antenna is minimal so as to not load the parallel resonant
circuit; a tradeoff actually between energy transfer and loading.
A better way might be to have a low Z tap on the inductor; a method
used in radios since the 60's i think.

Yes that can be done, but my inductor will be 660/46 litz wire.
I'm sure it's possible to make a tap, but with the cost of litz I don't
want to.

google me this:
rubberduck antenna replacement bnc

go through till you find one that looks like it covers the bands you
want.

an example:
http://www.scannermaster.com/All_Band_Rubber_Duck_Portable_BNC_Antenna_p/10-540710.htm

I guess you want to transmit?

I found this one, but not too sure if its suitable for transmitting.

Thank you Tony, for the good description you made.
I wrote a short basic program to calculate the parallel conversion.
I can run the numbers for different frequencies, and different Cs and Rs for
the antenna.
Thanks for the tip about the parallel inductor.
Thanks again, Mikek

So what is wrong with winding a "second" layer with only a few truns
(say 1/20 of larger coil) and connecting it series aiding, use whole
"tapped" (now) coil for the LC resonance and the use that (new) tap?
Besides, if it is not would, the amount of the wire would be no
different wether you put a tap in or not.

Hi Jake,

The problem is with a radio station you are NOT listening to that
overwhelms you receiver and silences the other (or forces a new
station over the) station you ARE listening to. This comes from the
lack of a tuned circuit in the receiver.

Your manual tune radio apparently has just such a tuned circuit which
you adjust by hand with the twist of a knob (old-school). Cheap sets
are tuned digitally (even though some of them, too, have a twist knob
to do it) and have no tuned circuit. What you describe is the classic
difference between the two, and living in a dense urban environment
increases the number AND proximity of strong stations that could lead
to this problem you describe.

If you have the provision for attaching an external antenna to the
problem receivers, then using a "rabbit ears" antenna, with careful
length adjustment might help (but it would seem unlikely). Notch
filters would also offer help, but this may be too sophisticated for
you if you are not a Ham or techie, and you are just visiting our
forum to tap our experience (which is perfectly OK).

>
>Does this seem like a situation where the one is likely to overwhelm the
>other, especially considering that they're not exactly neighbors on the
>dial? As a general matter, is it normal for a tuner to pick up separate
>frequencies when tuned to one?

It is found in all single conversion receivers and is called "Image"
reception. It can be observed when the interfering station is

different from the one you are listening to by twice the Intermediate Frequency. For FM, the IF (Intermediate Frequency) is generally 10.5 MHz. Now, given the FM band is only 20MHz wide, this condition is not commonly found in FM receivers. However, there are other transmitters nearby in the TV low VHF bands (if they have not gone dormant due to the DTV conversion). The aviation band is above FM, but it would seem unlikely to be the source of your problem by this mechanism.

Then it could be a very strong signal crowding its way in.

Saving a few cents on Lits wire will cost you almost half of the power
you could deliver to the tank.

This won't give you maximum power transfer.

Nothing wrong with that at all, there are many ways to build a crystal
radio.
Here's just 77 of them.
Have fun, Mikek

Hi Joe,

Care to go deeper? Would that "more than half the power" be 3.1dB?
6dB? 20dB?

Why "half the power" as a round number instead of a tenth?

Why, because I chose not to go into detail.

If you look only at a resistive source impedance, the most power we can get is

((Vsource/2)**2)/Rsource

Now the example starts with Rsource = 58 ohms and is trying to transform that to match a 1.5 Meg load. The power available from a source with 1.5 M source impedance is much less than that from a 58 ohm source.

Hint : 58/1.5M

So, doing something to match the tank to the load could be much more effective. A tapped coil or additional winding has been suggested.

Hi Joe,

It is a given that from the power available in the field, only half of
it at most will be captured - ever.

>So, doing something to match the tank to the load could be much more
>effective. A tapped coil or additional winding has been suggested.

Well, the discussion took a branch into resistive networks for the
simplicity of discussion, not as an example of a solution to the
practical problem.

A tapped coil is an excellant choice, of course, I offered that option
myself. A secondary coil, also suggested, is just as useful.

Some years back, I went to a welding shop and asked them to weld a steel
strap to the car for an antenna mount. They found a spot on the left rear
where the strap would stick out and hold a mobile antenna. The shop rounded
the edges on the part of the strap sticking out, and drilled a hole in the
strap for the insulated whip connector. It worked out great.

I'm about to install a 125 ft long antenna 30 ft high.
Is there any advantage to bringing the far end back
down to the ground or near the ground.
What does this extra wire do to the impedance?
Pattern?

Thanks, Mikek

It will probably lower the various 'natural' resonant frequencies a
little, and also change the angles and directions of signal pickup.
However, I don't think that you're unlikely to notice much difference.

If you do want to bring the far end down to ground level, you might like
to consider the potential reduction of local noise by inserting a
(typically) 9:1 impedance transformer and far end ground, and bringing
the RF signal back to the house via coax.

I got the wire up this morning/afternoon, I did leave the wire long at the
far end so
it will reach the ground. I'm not sure what I will do with it yet.
I'll add a little more info, it will have a dual purpose, First, I'm going
to characterize
it as a long wire for use with a crystal radio. I want to optimize it for
that.
I had thought about running a counterpoise along a fence, but I found a
better
tree that runs at an angle to the fence. How close does a counterpoise need
to
follow the antenna?

How do you think a chain link fence will work as a (grounded) counterpoise?

When the crystal radio excitement has run its course, I'll use it as an
antenna for
my general coverage radio, with that it's still mostly am BCB, but some 80
meter
listening too.
Thanks, Mikek

126. Magazine article "For the L of it".

I recall an article in QST or "73", I think the title was,
"For the L of it"
I'm looking for the magazine it was in and the date it was printed.
The article described a series LC, a fixed L and a air variable C.
The impedance of the L was bigger than the impedance of the C,
and by adjusting the C you caused the inductance to vary.
So in effect you have a variable inductor.
Thanks, Mikek

Or two caps in series connected paralell to an inductor. Input or
output at the juction of the caps. This concept of the circuit may be
more easily found in various reference manuals. You may find these
caps labeled TUNE and LOAD in some circuits.

I recall the article and have it around somewhere. The problem with this (if you want to call it a problem) is it only works for a small range of frequencies.

For instance, at 10 MHZ a series 1.6uH L and 318 pF C looks like a .8uH inductor (good). But at 5.76 MHZ the combination looks like 30 ohm Xc capacitor. At 7.0 MHZ it looks like a short because of series resonance.

I would not want to replace the roller inductor on my 80-10 antenna tuner with this, but there are other applications (single frequency) where it should work just fine.

Andy adds:

Another way to accomplish the coil isolation would be to use a
1:1
50 ohm wideband transformer from Mini-Ckts lab. They are only a
couple dollars...
If you have a good parts box, you can wind one yourself as they are
very simple. The ARRL handbook can give you guidance if you are
not familiar with the technique. Simply a bifilar winding around a
small ferrite toroid.....

I'd also still use a couple of backtoback diodes, in parallel with
a
neon lamp. Couldn't hurt..... might help, once.....

Back to back diodes will cause a problem if you have strong signals in the area (enough to get the diodes to start to conduct) from intermod.

Neon lamp fires at 60-70 volts.. hopefully whatever is downstream can tolerate that.

It's a classic problem.. all the things that protect the front end also degrade the performance in one way or another. You have to make the decision about whether you want best performance and highest risk or vice versa.

PstRotator is a program for antenna rotators control -
http://www.qsl.net/yo3dmu/index_Page346.htm
It works with a wide variety of rotators, supports a lot of loggers,
DX cluster clients, satellites and moon trackers, and supports multi-
user remote operation over the Internet. The user interface offers
quite a selection of methods for pointing and display, as well.

140. Math help characterizing Antenna, Please

Newsgroup: rec.radio.amateur.antenna
Date: 2011-01-23 17:10:32 UTC
From: amdx <amdx@knology.net>
Message-ID: <7e566$4d3c60cc$18ec6dd7$6748@KNOLOGY.NET>
Source record: 5941

I put up a long wire antenna, it is an inverted C.
The antenna is resonant at 3.55 Mhz.
I want to characterize it an the AM broadcast band.
I have made a measurement at 500 Khz and I had to install a parallel
capacitor
to get my variable inductor to bring phase to zero.
I don't know how to do the math to find the impedance of the antenna
with the L and C in the circuit.
Can someone look at my drawing and give me the math so I can figure out
the impedance. Then I can get the numbers at other frequencies for the band
and calculate those impedances.
See drawing here. I want to calculate the Unknown Impedance.
I need the R and the C of the antenna.
http://i395.photobucket.com/albums/pp37/Qmavam/Antennaat500Khz.jpg

Work backwards. You have a 55 ohm resistor in series with a 310 ohm reactance. Get the equivalent parallel combination of that (the complex reciprocal). Take the reciprocal of the capacitor (just invert the Xc and change the sign). Add the two complex numbers. Take the reciprocal of the answer. This is the impedance the antenna sees looking into the network. The antenna is the complex conjugate of that (just swap the sign of the imaginary part).

Does this help?

John

Dear Mikek (no call sign):

Assuming that the inductor is 3 +j310 because it must have some loss and calling the capacitor -j717, my trusty calculator estimates the antenna looks like 159 -j526. The real part seems high - probably due to ground losses.

However, the idea that even such a simple an antenna can be modeled as an R and C over the AM broadcast frequency range seems unlikely.

An instrument such as the AIM4170C would provide Z with greater confidence and do so at each frequency of interest. However, in the broadcast band it is not clear that such a set of impedances can be used for something useful. What is the actual goal?

Regards, Mac

I don't know, I not there yet.

55 + i310
complex reciprocal
55 - i310 / 55^2 + 310^2
reduce
55 - i310 / 3025 + 96100
reduce further
55 - i310 / 99125
Take the reciprocal of the capacitor (just invert the Xc and change the
sign).
Xc = -i717 so 1/i717 ???

Add the two complex numbers.
(55 - i310 / 99125) + (1/i717)
Any mistakes yet?
Going further doesn't get me the answer you have.
Mikek

From what I have read it seems very high, could I have 130 ohms of ground
loss?
I don't think so.

I'll be looking into the ground, I think it is just a 6 foot rod, I put it
in years ago.
I'll add FWIW, I connected the AC ground from a receptacle and it made zero
change.

> However, the idea that even such a simple an antenna can be modeled as an

Ya, that's not the plan, I'll check it every 100 khz and make a graph, with
R and C.

I put the antenna up for multiple use, but to start, I want to use it with a
crystal radio,
the measurements may help me figure out the series cap (range) needed to
make an
R match to the tank circuit over the band.
And it's a project that forces me learn some math.
Thanks, Mikek

Well, no, but you should simplify here.

> Going further doesn't get me the answer you have.

I can't tell why because you didn't show your work.

> Mikek
>
>

Convert the series impedance 55 + j310 to its parallel equivalent admittance (1/(55+j310) as follows:

1/(55+j310) = (55-j310)/(55+j310)(55-j310)

In other words, multiply the numerator AND denominator of 1/(55+j310) by the conjugate (55-j310) of the denominator.

This gives (55-j310)/(3025+96100) or (55-j310)/99125 which is an admittance of 554.85e-6-j3.127e-3.

The capacitor's parallel equivalent admittance is 1/(0-j717). So, when numerator and denominator are multiplied by the conjugate we get

0+j717)/(0+514.089e3) or j717/514.089e3 which is 0+1.395e-3.

Now the sum of (554.85e-6 - j3.127) and (0 + 1.945e-6) is

554.855e-6 - j1.733e-3

This the parallel equivalent (the admittance) of your components and what the antenna is seeing.

Following in the steps of my second and third sentences above, the equivalent series impedance of your network looking back toward the resistor is the reciprocal of that, or

167.63 + j523.5

This is the impedance the antenna sees. The antenna's equivalent impedance is the conjugate of that. That is, the antenna looks like an impedance of 167.63 - j523.5 according to your data.

A calculator that handles complex numbers is invaluable. I have one on my computer's desktop. I also have an electronic Smith chart which is usually faster. If you need a link, let me know.

This whole thing may look a bit complicated to you if you are not familiar with complex numbers. Look up how to do X, /, +, - using complex numbers and get familiar. It will help.

Cheers,
John

One other possibility is one of the four magnet magmount setups. Some even come with coax. I've even seen such mounts used for screwdrivers if you still have your prior one. Before anyone points out they have to be grounded properly, the mounting holes for the roof mount offer access to at least some grounding with the proper short bolt. I suspect such a scheme might have the grounding strap()/wire(s) too long at 10 meters, but for 17 meters through 75, probably should be adequate.

149. January 2011, Updated list of solutions manuals & test banks!!!!

Dear Mikek: Thank you for your response. Knowing goals is important.

A great deal could be learned by using an antenna modeling computer program such as EZNEC.

Note that my estimate of the antenna's Z is calculated with one assumption (some loss in the series inductor) and that its calculations equate 55 + j0 to the impedance of the inductor, capacitor and antenna. Some of the calculations I have seen seem to assume that one has applied 55 ohms and then look backwards from the antenna.

Place my estimate of 159 -j526 in parallel with -j717 and then add (the series) 3 + j310. You should fine the result to be
55.053 -j 0.0711 which is close to 55.

Maximizing the sensitivity of a semiconductor diode detector is probably done empirically because of the difficulty of finding an appropriate model for the non-linear detector. Expect that the apparent answer will be amplitude dependent.

Do report you findings. Regards, Mac

From what I have read it seems very high, could I have 130 ohms of ground loss?
I don't think so.

I'll be looking into the ground, I think it is just a 6 foot rod, I put it in years ago.
I'll add FWIW, I connected the AC ground from a receptacle and it made zero change.

> However, the idea that even such a simple an antenna can be modeled as an

Ya, that's not the plan, I'll check it every 100 khz and make a graph, with R and C.

> An instrument such as the AIM4170C would provide Z with greater confidence

I put the antenna up for multiple use, but to start, I want to use it with a
crystal radio,
the measurements may help me figure out the series cap (range) needed to
make an
R match to the tank circuit over the band.
And it's a project that forces me learn some math.
Thanks, Mikek

Hi J. C.
If your interested in the diode characterists Ben Tongue has done a lot of
crystal radio work.
http://www.bentongue.com/xtalset/xtalset.html
Articles 6, 7, 8, 9 , 10, 15A, 16, 17A, 27 and 28 are all about detector
diodes and there characteristics.
Thanks, Mikek

On many cars these days, there is a plastic cover at the end of the roof
rack that covers a bolt that holds the rack onto the car. A ring lug
under the bolt and a black powerpole connector glued into a notch cut in
that plastic cover might give a really nice connection to the metal roof.

Ed,

The Smith Charts with R=1 in the center are normalized charts. If you have 50 ohm coaxial cable, just multiply the numbers by 50. You may occasionally use 75 ohm cable. While you can buy charts with R=75 in the center, all you have to do with a normalized chart is to multiply the values by 75. I doubt if you can even buy charts specifically for 93 ohm (RG-62) cable, 300 ohm twinlead, or 450 and 440 ohm "window" line.

I always compute the reflection coefficient from a complex load before I calculate the VSWR.

? (Greek capital letter Gamma) = (Zmeas - Zline)/(Zmeas + Zline)

We usually think that we can replace the line impedance with 50 + j0, but as my friend Tom, K7ITM, often points out, so-called 50 ohm cable no longer has a purely resistive characteristic impedance at low frequencies. So we need to calculate the reflection coefficient as a complex number. Once we have this, we need to determine the magnitude of the reflection coefficient.

? (Greek lower case rho) = |?|

= sqrt(Real*Real + Imag*Imag)

Once we know the magnitude of the reflection coefficient, which is always less than or equal to unity, the voltage standing wave ratio is simply

VSWR = (1 + ?)/(1 - ?)

If you have Windoze, all of these calculations are easily done in Excel. You may have to install the Analysis Toolpack to get Excel to handle complex numbers.

I strongly suggest that you continue to use Smith charts. The first large program for my TI-59 calculator nearly forty years ago was an electronic Smith chart. It was handy. but I continued to use Smith charts because they offer graphically significant insight into what happens along the length of a transmission line. Additionally, they help you catch mistakes.

73, Barry WA4VZQ

Postscript: I used rich text format solely because I could use Greek letters. Gamma and rho are almost universally used to represent the complex reflection coefficient and its magnitude respectively in engineering publications.

Hello, and I believe some clarification is needed here. First, for most ham radio applications we can assume a real characteristic impedance for the transmission line (e.g. Zo = Ro = 50 ohms). The only time this leads to large errors when calculating the line-transformed load impedance (e.g. an antenna at a given frequency) occurs when the VSWR of the load is greater than 10 or 20. (This was pointed out in a 1953 AIEE paper by W. W. Macalpine.)

However, just because the reference impedance, Zo, is assumed to be real doesn't mean that the reflection coefficient has to be real. Sincerely, and 73s from N4GGO,

Thanks for commenting, James.

I decided to calculate the characteristic impedance of Times Microwave LMR-240 cable at several frequencies just to see. This is basically a foamed dielectric version of RG-58 and I had the data handy.

The equation for characteristic impedance is:

Zo = sqrt[(R + j*w*L) / (G + j*w*C)]

where: R = distributed series resistance, Ohms/meter
L = distributed series inductance, Henries/meter
G = distributed shunt conductance, Siemens/meter
C = distributed shunt capacitance, Farads/meter
w = radian frequency, 2*Pi*f, radians/second.

For LMR-240, Times gives:

Inner Conductor Solid BC 0.056 in (1.42 mm)
Dielectric Foam Polyethylene 0.150 in (3.81 mm)
Outer Conductor Aluminum Tape 0.155 in (3.94 mm)
Overall Braid Tinned Copper 0.178 in (4.52 mm)

Velocity of Propagation 84%
Dielectric Constant NA 1.42
Time Delay nS/ft (nS/m) 1.21 (3.97)
Impedance ohms 50
Capacitance pF/ft (pF/m) 24.2 (79.4)
Inductance uH/ft (uH/m) 0.060 (0.20)
Shielding Effectiveness dB >90
DC Resistance
Inner Conductor ohms/1000ft (/km) 3.2 (10.5)
Outer Conductor ohms/1000ft (/km) 3.89 (12.8)
Voltage Withstand Volts DC 1500
Jacket Spark Volts RMS 5000
Peak Power kW 5.6

So with this data, assuming the resistance is constant with frequency (reasonable considering the skin depth), we get:

R = (10.5 + 12.8)ohms/1E3-meters = 0.0233 ohm/meter
L = 0.20 uH/meter = 2E-7 Henry/meter
C = 79.4 pF/meter = 7.94E=11 Farad/meter

To get G, we know that the dielectric is foamed polyethylene with a resistivity of 1E16 ohm-cm, or 1E14 Ohm-meter. The equation for conductance in the concentric configuration of coaxial cable is:

G = G = 2*Pi*Sigma/ln(B/A) = 6.283E-14/ln(3.81/1.42) = 6.366E-14 Siemans/meter

At this point, I used Excel 2003 with the Analysis Toolpack to do the caculations with complex numbers. While Excel does the calculations without difficulty, Microsoft never thought about formatting complex numbers, so the following table is edited from Excel by hand. :-(apologize for any transcription errors.

Frequency, Hz Characteristic Impedance, Ohms Magnitude Phase, degrees
1.000E00 4832.837 - j4831.960 6834.044 -44.4994
1.000E01 1528.565 - j1527.717 2161.115 -44.9842
1.000E02 484.545 - j481.932 683.409 -44.8455
1.000E03 156.989 - j148.750 216.284 -43.4564
1.000E04 62.551 - j37.333 72.845 -30.8304
1.000E05 50.402 - j4.633 50.614 - 5.2521
1.000E06 50.191 - j0.465 50.193 - 0.5311
1.000E07 50.189 - j0.001 50.187 - 0.0531

So as we go increasingly below one MegaHertz, the characteristic impedance of the cable increases to above 50 ohms and it becomes increasingly capacitive. If the FCC grants hams a band in the LF region, we might have to consider this. But then, our cables will be very short in terms of wavelength.

They do the reverse of this in AM broadcast antenna matching
networks (doghouses) where the object is NOT to have a variable
capacitor. A fixed, high-reactance capacitor is placed in series
with a 'tappable' inductor and the capacitor is 'tuned' by adjusting
the tap on the inductor. Again, works well at one frequency,
but not over an octave bandwidth.... K7JEB

The OP's arrangement works well for impedance matching and is suitable
for tuning a circuit to resonance. I dont believe the circuit he
described would be much different from the resonant circuit in a
Colpitts osc.

170. SW antenna for Grundig Satellit 750?

Newsgroup: rec.radio.amateur.antenna
Date: 2011-01-31 00:05:58 UTC
From: PapiBow <PapiBow.78bfa58@radiobanter.com>
Message-ID: <PapiBow.78bfa58@radiobanter.com>
Source record: 5821

I am considering this antenna for Grundig Satellit 750, link below.

http://universal-radio.com/catalog/sw_ant/3377.html

my first question is about the effectiveness of this antenna in a limited space on patio of about 15 feet by 15 feet, next to a 2-story building. I would raise the antenna center to about 10 feet and then run each of the 40-foot wings in zigzags on the sides. Later, I might move to a larger place and have full space for the antenna. I do not want to buy an antenna for limited space now if this antenna could be made as effective for the limited space as an antenna designed for smaller space.

the second question is about durability, is it solid construction to last for years?

the third question is about any extra hardware needed. My Grundig radio has a female BNC socket 50-ohm. This antenna comes with coax cable RG-8X and PL-259. This means I need an adapter from PL-259 to BNC. Will this adapter create any noise? Do I need any additional hardware to make it work better, like a preamp?

> So as we go increasingly below one MegaHertz, the characteristic impedance of the cable increases to above 50 ohms and it becomes increasingly capacitive. If the FCC grants hams a band in the LF region, we might have to consider this. But then, our cables will be very short in terms of wavelength.
>
>   73, Dr. Barry L. Ornitz   WA4VZQ

Barry's assumption of resistance being the same as the DC resistance and independent of frequency will make the characteristic impedance look closer to resistive than it actually is, at frequencies where skin depth is small compared with conductor thickness. Since in copper, skin depth at 1MHz is only about 2.6 mils (and is inversely proportional to the square root of the frequency), the resistance of that particular line's conductors at 1MHz will be considerably higher than the DC resistance.

Dare I mention that when the line impedance is reactive, you can get reflection coefficients with magnitude greater than unity? Seems like every time that comes up here, someone gets their knickers in a knot about it. Reflection coefficient = rho = (Z-Zo)/(Z+Zo), so if Z (the load impedance) is a pure inductance, say +j50 ohms, and the line impedance is (from Barry's chart) 50.4-j4.63 ohms, then rho = -0.0134+j1.096, and |rho| = 1.096. But to calm your nerves, calculate what the impedance is looking into any length of that line you wish, terminated that way, and you'll see that the impedance never has a negative real part.

Cheers,
Tom

If anything would improve your situation, it would be raising it
higher.

>the second question is about durability, is it solid construction to
>last for years?

Dunno. At the prices shown, they are within ballpark for the
complexity offered. Wire lasts a long time. You could certainly pay
more, much more, and obtain no better results on your radio, and for
no longer life in the air.

Not in the least.

>Do I need any additional hardware to make it
>work better, like a preamp?

Get a cheap antenna tuner. Look around for Ham radio antenna tuners
that do not have metering (you don't need, and couldn't use it
anyway). If you come across one that has metering, and is cheap
enough, buy it.

You can also build your own tuner if you are hobby inclined. It is simple enough, requires few skills, tools (a soldering iron) and parts (two multiposition switchs, make your own coil, find two variable capacitors) in a box.

PapiBow

I just can't see paying over $ 150 for a bunch of wire to use as a receiving antenna. Think I would just put up a center insulator and as much wire as I could in the space you have. Also do a search for a Windom antenna. You probably will get the same results for a lot less money.

175. A small riddle, just for fun

Newsgroup: rec.radio.amateur.antenna
Date: 2011-01-31 20:20:57 UTC
From: Antonio Vernucci <vernucci@tin.it>
Message-ID: <4d4719a9$0$2057$4fafbaef@reader1.news.tin.it>
Source record: 5826

Yesterday, while repairing my antenna, something came to my mind I had never focused on before.

Let us consider a bipole, that is a "black box" having TWO terminals and including plain passive elements only (like capacitors, inductors, ... , no diodes or other special devices), arranged the way you prefer, it does not matter.

In my mind it was quite clear that, when fitting such a bipole into a circuit, the sense makes no difference, i.e. one can reverse the two terminals with no consequence. As a matter of fact, the bipole has an equivalent impedance that remains the same independently of the way it is put in the circuit.

Yesterday a case occurred to me in which this is not actually true.

Instead of directly telling which it is, just for fun I wonder whether anyone can figure out a case in which a bipole may not be reversed without consequences. Not difficult, but it anyway requires some thinking.

Although probably unnecessary, let me recall that a filter is typically a THREE-terminal device (IN, OUT, GROUND), not a TWO-terminal one.

Hello Tony,

The answer may be in your own text (the ground issue). There may be a
third path via ground (capacitive coupling).

You can add a very good common mode choke at the input terminal of you
bipole. In that case the path via ground is blocked.

Try a very simple bipole: metallic case connected to terminal 1,
terminal 2 connected to nothing. When the center conductor of your
source is connected to terminal 1, you have the ground path.

The effect of reverse connection will be less when you use a very
small battery powered source that is completely floating. Measuring
data you can get out of it via optical link...

Best regards,

Wim
PA3DJS
www.tetech.nl
without abc, PM will reach me.

Hi Wim,

I acknowledege that your example leads to an asymmetric bipole, that one cannot reverse it without consequences.

However, in the case which occurred to me, there is no need to assume the existence of a third path via ground for justifying the asymmetry. Actually the asimmetry remains even if the bipole would be in free space!

Forgive me if I do not immediately reveal my case, but I would like to see if there are some more guesses before closing the issue.

An electrolytic capacitor acts differently if reverse biased. The results
are usually bad. It does qualify as two leaded, passive and linear when used
properly.

as long as it is ONLY 2 ports, has ONLY passive linear components, AND
is small enough to be considered a lumped element, then you can always
reverse the terminals and not know the difference. The most
frequently violated condition is the last one, put in a piece of coax
with that is long enough to be measured at the highest frequency you
will use and all bets are off.

On second glance at the page, I noticed my eye was drawn to the cost
of the downlead, not the antenna. Yes, $150 + another $30 - $40 is a
lot of money to spend, if you can "do it yourself." Most can do it
themselves - wanting to is another matter.

Hi Antonio,

This would fall into the area of a hidden variable (a ghost terminal,
so-to-speak) and is called Common Mode. This occurs in the situation
that includes the proximity of ground which is often neglected as an
influence.

The dipole could be unbalanced forcing currents to be out of balance.
This is notorious with cabled down leads which preserves the sense of
two terminals, but the imbalance with ground forces a third terminal
into the reality of implementation.

If we were to divorce ground from this (free space) and simply looked
at the two lead impedance at the drive point, then adding a cable will
force the same imbalance (albeit to a different degree, as found with
the proximity of earth). If the dipole is off-center fed, this will
be more profound (even though when it is measured at the feed point,
the measurement is immune to pole switching).

Reversing the "polarity" of the cable connection will create a new
topology (although the Common Mode will persist with new
characteristics).

>Although probably unnecessary, let me recall that a filter is typically a
>THREE-terminal device (IN, OUT, GROUND), not a TWO-terminal one.

Well, even though I have anticipated ground, a filter can easily be a
two terminal device without need for ground - being a series
component. This two terminal description is quite typical too.

Hi Joe,

The same can be said of a diode. Hence the electrolytic capacitor is
non-linear, which violates the premise.

an electrolytic that acts that way is not a linear component.

Posting-Frequency: posted monthly
URL: http://www.panix.com/~rram/usenet/rram/index.html

Changes followed by "|".

After a 30-day public discussion and feedback period to gauge reader
opinions in March of 2009:

http://groups.google.com/group/rec.radio.amateur.moderated/browse_thread/thread/d7d337db35
f23326

the rec.radio.amateur.moderated Moderation Team has decided to consider
amending its charter, and permit limited simultaneous crossposting to
rec.radio.amateur.moderated and one other unmoderated
amateur-radio-related discussion newsgroup. We are currently trying
this on a temporary basis (90 days, through early July 2009), and adopt
it permanently if successful.

Approved rec.radio.amateur.* newsgroups are those that are currently
listed in the latest version of the "List of Big Eight Newsgroups" which
is crossposted monthly to news.announce.newgroups, news.groups, and
news.lists.misc.

Approved alt.radio.amateur.* and alt.ham-radio.* newsgroups are those
that have been created consistent with the suggestions in "So You Want
to Create an Alt Newsgroup" at:

http://www.faqs.org/faqs/alt-creation-guide/

Approved regional hierarchy newsgroups are those that contain either
"radio.amateur" or "ham-radio" in their names, including
uk.radio.amateur and aus.radio.amateur.misc.

We will make every reasonable effort to keep our list of approved
newsgroups up-to-date. In case we have overlooked any, and a submission
is rejected in error as a result, the rejected submitter can E-mail us
at our administrative contact address (in the signature at the bottom of
this article, and the default Reply-To for the rejection message)
requesting that it be added, and that the article be approved. We may
still choose to reject articles crossposted to any alt.* newsgroup with
an inappropriate name, including obscene language, embedded
name-calling, or encouragement of unlawful conduct.

From: eddy <eddy.78da038@radiobanter.com>
Message-ID: <eddy.78da038@radiobanter.com>
Source record: 5837

To to feed a delta loop with a 1/4 wavellenght coaxial section I used my MFJ259B following the instruction of the MFJ259b manual (7.1 Testing Stubs)
To verify the section I have followed other two methods:
1. MFJ259 manual (Testing Stub with help of 50ohm resistor for lowest SWR)
2. ON4UN method described by Low-Band Dxing Book (Chapter 6, Quarter-wave matching section)

The measures that I got with each of the three methods are too different.
By accepting a reasonable differences in the results, which of the three methods are considered more reliable ?

I assume you are trying to configure a 1/4WL 75 ohm piece of coax to interface to your ~100 ohm loop. What I would do is cut it a little longer than 1/4WL with the velocity factor taken into account. Connect it to the antenna and trim for lowest SWR on the MFJ258B. Why bother with an exact 1/4WL when you can trim for lowest SWR using the actual antenna?

I have a circuit I've been working on lately which has a simple series
LC in it, no other connection to the node between the inductor and
capacitor. It turns out that the order of the inductor and capacitor
makes a big difference in the circuit performance. I anticipated that
it would, and put them in the intuitively obvious order, only to find
out that it was the wrong order! A proper model cleared things up
quite nicely. However, in no way would I call that particular part of
the circuit a "two terminal" network. The effect is the same as Wim
mentioned.

Cheers,
Tom

As long as it is ONLY 2 ports, has ONLY passive linear components, AND
is small enough to be considered a lumped element, then you can always
reverse the terminals and not know the difference. The most
frequently violated condition is the last one, put in a piece of coax
with that is long enough to be measured at the highest frequency you
will use and all bets are off.

Could you please explain me the meaning of your sentence:

"put in a piece of coax with that is long enough to be measured at the highest
frequency you will use and all bets are off"

as I have difficulties to interpret it due to my non-mother tongue english.

Hi Eddy,

> which of the three
>methods are considered more reliable ?

The first: 7.1 Testing Stubs

The second method has no sensitivity (Q = 1). The third method
surprises me - a topic for Longwave?

the general case is, if any part of the circuit is more than a small
fraction of a wavelength in size you may be able to detect the
difference between the ports. one common way to do that is to try to
measure a circuit that has a long piece of coax in it, the results may
be very different when you reverse the terminals.

then there is either something wrong with your components or you have
too much coupling the the surrounding environment... so you really had
a 3 terminal network using the stray capacitance or inductance.

If by "too much" you mean "more than I wanted," you're absolutely right. But of course with real components, there is no such thing as zero coupling to the surrounding environment. As with all real circuits, there are tradeoffs: high coil Q results in a large coil, which in turn results in more capacitance to the shield than a smaller low-Q coil would have. The shield is required for other reasons...

> ... so you really had
> a 3 terminal network using the stray capacitance or inductance.

Exactly. Just what I said: the effect is the same as Wim mentioned.

Cheers,
Tom

This can be neutralized employing a "Wagner Earth." For inductors,
there is the Modified Owen method.

Basically, problems of this sort have been handled with driven shields
(a variant of the Wagner Earth/Ground). This exactly century-old
topic ("Wagner Earth") is rarely discussed outside of precision
measurement or very high voltage handling circuits, however.

You have pinpointed the correct issue: lumped elements.

The story began when, a few days ago, I was going to replace a trap of my HF yagi. Not to make mistakes, I consulted the antenna assembly manual where I found a big banner: do not invert traps otherwise the antenna will not work.

So, I thought, this is a case in which a bipole cannot be inverted.

This is clearly due to the fact that the external body of the trap (an aluminuim can about 2 feet long), which contains two coils resonated at different frequencies by means of built-in capacitors, is effectively part of the antenna radiating element. So, the trap is a bipole not only comprising lumped elements, and that is the reason why it cannot be inverted.

So, I thought, this is a case in which a bipole cannot be inverted.

This is clearly due to the fact that the external body of the trap (an aluminuim can about 2 feet long), which contains two coils resonated at different frequencies by means of built-in capacitors, is effectively part of the antenna radiating element. So, the trap is a bipole not only comprising lumped elements, and that is the reason why it cannot be inverted.

So, as K1TTT has pointed out, a bipole can be inverted without consequences only if it has only 2 ports, has only passive linear components, and is small enough to be considered a lumped element.

Hello Tony,

So it isn't a bipole.

The tube containing the trap is a (short) common mode transmission
line that has effect on its environment (like a metal case with its
capacitive effect on ground). The trap inside the metal tube is in
series with the end of the short transmission line.

The ground in this case is the boundary where the near field is no
longer dominant w.r.t. to the radiating field. Think of a circular
ground at 0.16lambda from the structure. So one end of your bipole
has more ground to this virtual ground and is therefore a 3-pole
device.

For the limitation on lumped circuit approach, it is not important
whether or not it contributes to the overall radiation of a
structure. When you make a floating ground out of 4 quarter-wave
radials (monopole?), this structure has minor influence on the far
field pattern of the quarter wave (or better half wave) radiator above
it.

In http://www.padrak.com/ine/FARADAY1.html Faraday wrote:

"The view which I am so bold to put forth considers, therefore, radiation as
a kind of species of vibration in the lines of force which are known to
connect particles and also masses of matter together. It endeavors to
dismiss the aether, but not the vibration. The kind of vibration which, I
believe, can alone account for the wonderful, varied, and beautiful
phaenomena of polarization, is not the same as that which occurs on the
surface of disturbed water, or the waves of sound in gases or liquids, for
the vibrations in these cases are direct, or to and from the centre of
action, whereas the former are lateral. It seems to me, that the resultant
of two or more lines of force is in an apt condition for that action which
may be considered as equivalent to a lateral vibration; whereas a uniform
medium, like the aether, does not appear apt, or more apt than air or
water."

Is your 4 quarter-wave radials (monopole?), the same like Faraday's lines?
Two or more monopoles produces "polarised waves".

Two or more monopoles "is in an apt condition for that action which may be
considered as equivalent to a lateral vibration;".

Some textbooks say that Faraday suggested the transverse (angular)
wibrations.
Did he?

Hi Antonio,

No, in fact.

You clearly state in the first sentence the reason why.

The external body renders an asymmetry. The two elements it separates
are also non-symmetrical (both physically and electrically).

This is NOT a lumped circuit exercise that has gone bad.

A bipole is symmetrical, obviously the internal circuity of the trap
is not symmetrical .

Jimmie, that is not the point.

- if the bipole is made of lumped components, then it can be freely reversed
without consequences, independently of whether it is symmetrical or asymmetrical

- a trap, which instead contains a distributed element (that is the radiating
trap body), can be freely reversed without consequences only if it is
symmetrical (which is not my case).

At some frequency, everything becomes a distributed component, it
depends on size/lambda ratio and application. Many distributed
components can be modelled based on theoretical lumped components
(with sufficient accuracy), but a ground for modelling stray
capacitance is frequently required.

True lumped component behaviour, in my opinion, only applies to
networks with size=0.

I hope you can read what you quoted above and understand it... note
specifically:

> It endeavors to
> dismiss the aether, but not the vibration.

so with this he has decided there is NO aether!

> is not the same as that which occurs on the
> surface of disturbed water, or the waves of sound in gases or liquids,

so all the comparisons to water waves or sound waves are NOT correct!

> equivalent to a lateral vibration

NOT longitudinal!

so by these statements he has said that electromagnetic waves ARE NOT caused by an aether, and ARE lateral, NOT longitudinal... and CAN NOT be compared to sound or water vibrations!

'True' or theoretical versus 'practical' is a very important
distinction that is, or at least was, taught in engineering classes.
it is very important to know when you can apply the practical
simplifications that allow you to do design work without worrying
about insignificant phenomena in the problem domain you are working
in... so if i am designing an HF antenna I know that objects below a
given size can be safely ignored, but if i'm doing a microwave design
i have to take into account much smaller objects.

And not traversal. The waves radiated from the two ends of a dipole I call "coupled".

>so by these statements he has said that electromagnetic waves ARE NOT caused by an aether, and ARE lateral, NOT longitudinal... and CAN NOT be compared to sound or water vibrations!

Faraday was great. In the Nature no natural acoustic dipoles. For him was obvious that must be something equivalent to a lateral vibration.
As you know it is the two or more sources of pressure waves properly phased.

Are electrons jumping off from your transmitting antennas?
In copper and in space are the same "little nuclei, considered in the abstract as matter". Electrons have mass.

Biot-Savart's magnetic whirl is massles.

no, electrons don't jump off my antennas, and there can not be free
electrons in space or they would all repel each other and fly away.
and since they have mass and other detectable properties we would
easily be able to measure them if they were conducting electromagnetic
waves, such a simple thing as speed of the wave would be VERY
different than what we measure now.

As I see it, it has nothing to do with being small enough to be considered a lumped element. Instead, it has to do with coupling between the network elements and the outside world. Clearly your trap is coupled to the outside world. Clearly the series LC in my example is coupled to its surroundings. In such cases, you're NOT dealing with a two-terminal network: there is a path for current other than the two terminals. You can put as many transmission lines in your network as you wish, and as long as they don't have coupling to the rest of the universe except through the two closely-spaced terminals, there will be no difference in behaviour if you reverse the terminals. If you can show a valid counter-example, you've proven a whole lot of textbooks wrong...

I suppose equivalently, if you decouple your measurement from the rest of the universe, you'll get the same result. Typical broadband directional couplers (of the sort used in S-parameter test sets) have good decoupling, to be able to separate excitation from return power.

Cheers,
Tom

Correct, he's nuts.

218. My first antenna "design"

Newsgroup: rec.radio.amateur.antenna
Date: 2011-02-03 01:48:45 UTC
From: John - KD5YI <sophi.2@invalid.org>
Message-ID: <iid1hv$16i$1@news.eternal-september.org>
Source record: 5869

I had an idea that seems to work.

I like inherently DC-shorted antennas because of an experience I had about 30 years ago with thunderstorms. Using a home-brew quarter-wave vertical on 2 meters, my receiver got completely blocked for about 10 seconds by a lightning stroke a few miles from my location. I was terrified that I had lost the front end of the IC-2AT. Fortunately, I did not, but that experience apparently imprinted on my so-called brain. I know that I could add a shunt inductor across the terminals to prevent this, but I prefer a natural or inherent solution.

The folded vertical unipole is inherently "grounded". (I use quotes here because what I really mean is that the antenna input is DC-connected to the common.) So, I like that antenna. However, its terminal impedance is about 4 times that of a simple ground plane.

Well, I noticed that the terminal impedance of a simple quarter-wave unipole was about 30 or so ohms until the radials are sloped downward at about 45 degrees which raises the terminal impedance to about 50 ohms.

In my case, I needed to lower the terminal impedance (about 120 to 140 ohms) of the folded antenna. Well, what if I sloped the radials *upward* approximately 45 degrees to lower the terminal impedance to about 50 ohms?

It worked, and EZNEC says that the radiation pattern is pretty much like the usual ground plane vertical.

I just thought I would share this info with the group. I also have a configuration for a full-wave loop (inherently at DC common) on 70 cm that has an infinite balun thanks to Walter Maxwell's book Reflections II, page 22-10. How I manage to get the terminal impedance to 50 ohms is interesting, but I will save that for another post.

Cheers,
John KD5YI

Tesla did the electron gun from an antenna. Why yours are different?

>and there can not be free
electrons in space or they would all repel each other and fly away.

They do. The rare plasma is produced by the Sun. After condensation they
come back to stars.

>and since they have mass and other detectable properties we would
easily be able to measure them if they were conducting electromagnetic
waves,

The electron gun produces the catode rays. You are able to measure them. Put
on a glas bottle with the anticatode on the top of CB radio antenna.
Your current meter measures the DC ground current.

>such a simple thing as speed of the wave would be VERY
different than what we measure now.

Speed of the electric waves is and will be the same for ever. Of course for
the same temperature.

Faraday stated that must be: "that action which may be considered as
equivalent to a lateral vibration; "

The two (or more) sources give the same result like mystery TEM.

Are you better than Faraday?

You're right, trimming is the easiest method to matching a delta loop.
Anyway I hope my Analyzer could help me to get 1/2 wave coax and some
sections for a phasing system

The ones I've used seemed so broad, trimming really didn't
seem to be needed. It's kind of like using a matching device
with a mobile antenna. For most, it will be left at a single
setting, even for a whole band, and any tweaking done will be
at the antenna. I'll usually cut one to the usual length and
throw it up. IE: for 40m, I just cut 22 feet and I'm usually
done with it. They don't seem that critical.
I have an old puter program that would calculate those for most
any situation, but it must be on one of the drives I'm not using
at the moment.

it all depends on who is writing history:

"The four partial differential equations, now known as Maxwell's equations, first appeared in fully developed form in Electricity and Magnetism (1873). Most of this work was done by Maxwell at Glenlair during the period between holding his London post and his taking up the Cavendish chair. They are one of the great achievements of 19th-century mathematics."

Yes, indeed it does matter who is "writing history." The quotation
above is, in fact, quite wrong.

"Maxwell's formulation of electromagnetism consisted
of 20 equations in 20 variables. Heaviside employed
the curl and divergence operators of the vector
calculus to reformulate these 20 equations into
four equations in four variables (B, E, J, and rho),
the form by which they have been known ever
since (see Maxwell's equations)."

This "writing of history" above comes from:
http://en.wikipedia.org/wiki/Heaviside
where the embedded link to (see Maxwell's equations) is:
http://en.wikipedia.org/wiki/Maxwell%27s_equations
which then "RE-WRITES HISTORY" to state that the forms of the four
equations (formulated by Heaviside) were original to Maxwell (whose
work of 20 are ignored).

This, of course, will have no effect on the Soviet-inspired
revisionist polemic that un-informs this side thread from S* our
amateur doctrinaire.

* * * * * *

As an experiment at translate.google.com, I entered that last
paragraph above, translated it into Polish, and then took the Polish
output and ran it through (in reverse as it were) to see what that
looked like in English:

"This, of course, will not affect the relationship inspired
revisionist polemic that does not inform the thread-by-S * our
doctrinaire enthusiasts."

Curious how the "Soviet" was airbrushed out of translation.

So through carefully crafting the statement to preserve its piquancy,
I amended it to:

This, of course, will have no effect on the Stalinist-inspired
revisionist polemic that un-informs this side thread from S* our
amateur doctrinaire.

English-Polish-English renders:

"This, of course, will have no impact on the Stalinist-inspired
revisionist polemic that does not inform the thread-by-S * our
doctrinaire enthusiasts."

Aside from the last plural in place of singular, quite faithful to the
intended irony.

* * * * * * *

I wasn't going to try to push Maxwell's 20 equations through
translate.google.com to see if Heaviside emerged.

You wrote: "Yes, indeed it does matter who is "writing history." The
quotation
above is, in fact, quite wrong."

So the best approach is to take a glance into the original papers.
In Maxwell's model the magnetic lines are like the smoke rings. Nothing flow
along them.
In Heaviside's model there is the solenoidal flow.

It is not simplification. The both models are quite different.

But the both are a history.

Your radio waves travel in rare plasma. It is interesting that Faraday
predicted it.

they may travel through a rare plasma, but the rare plasma is not
needed for their propagation. they also travel through dense matter
like glass, but the glass is not needed for their propagation.

How about using a bicycle carrier and attaching the antenna to it? The
load would be better distributed.

like glass, but the glass is not needed for their propagation.

"The velocity of light through space is about 190,000 miles in a second; the
velocity of electricity is, by the experiments of Wheatstone, shown to be as
great as this,"

For this reason Faraday concluded: " "I suppose we may compare together the
matter of the aether
and ordinary matter (as, for instance, the copper of the wire through which
the electricity is conducted), and consider them as alike in their essential
constitution; i.e. either as both composed of little nuclei, considered in
the abstract as matter"

Everywhere are "nuclei" (electrons).

You simply do not read Faraday.

He also described a dipole: " For suppose two bodies, A B, distant from each
other and under mutual action, and therefore connected by lines of force,
and let us fix our attention upon one resultant of force, having an
invariable direction as regards space; if one of the bodies move in the

least degree right or left, or if its power be shifted for a moment within the mass (neither of these cases being difficult to realise if A and B be either electric or magnetic bodies), then an effect equivalent to a lateral disturbance will take place in the resultant upon which we are fixing our attention; for, either it will increase in force whilst the neighboring results are diminishing, or it will fall in force as they are increasing."

" if its power be shifted for a moment within the mass" = if electrons oscillate in a dipole.

Wimpie mentioned a monopole. Dipole = two monopole.

What does monopole radiate?

In your antennas and in the space are free electrons. We do not need a mystery TEM..

Depends. If the monopole is pointed upwards, it radiates positive half cycles of RF. If pointed downwards, negative half cycles are radiated.

Faraday was proven wrong many times by much later experiments... the
same for all other aether models. EM waves do not need aether or your
free electrons.

It would be interesting to see one such example.

Faraday's classic "The Chemical History of a Candle" may be expressed in archaic language (not really that archaic once you get into the vernacular), but it is an example of extremely clear analysis and instruction. There is absolutely nothing wrong anywhere in that recital.

Faraday examined the properties of induction - action at a distance - in equally archaic terms, but with scientifically rigorous methods. The archaic language was confined to terms of invention. Phlogiston, as both a term and concept, was an invented word that was current during his life.

I am sure he used the Phlogiston in correspondence with those who understood its context. However, the nature of that correspondence reveals that neither party "believed" in it as a force of nature, and merely used the term and concept as a touchstone insofar as it was a focus of debate.

In other words, for them the debate was over and Phlogiston was an intellectual dead-end, but the focus of the underlying question it was supposed to have answered was a question still being discussed.

Depends on which way it's pointing. If North, positive half cycles go West and negative half cycles go East.

If it is tipped to an undefined angle, the positive and negative half cycles get confused and the electrons refuse to jump off. This makes it good only for receiving.

There really are no good solutions for these newer toy
cars. That's why I don't have an antenna on my Corolla
even 3-4 years after I bought it. :/ Not even a 2m whip.
I had an Accord before the Corolla, and I drilled a
hole in the trunk and reinforced it with plates under
the trunk. It still distorted the thin metal of the trunk
after a while. My antennas are tall, and I *will* hit
something sooner or later. Usually trees.. But even the
lower stress of highway speed wind will distort one after
a while. The bike racks can be used, but you would have to
search long and hard to find a worse place to mount an
antenna. The ground losses will be much greater than any
antenna mounted up on the car. I don't care how well it's
grounded via wires.. The wire grounding scheme with little
metal under the base of the antenna just doesn't get it done.
It will be a good DC ground, but a piss poor RF ground.
Expect performance to basically suck.. :(
So... I've pretty much given up trying to mount an antenna
on that car. It will end up trashing my car, and being as it's
still fairly pristine, I'm not willing to do it.
I've still got my old trucks if I really have to have a radio
and antenna. They have antenna mounts which work well and
never a concern about warping metal. I just have to cough up
lots more for gas.
When I drive up to my place in OK, it's a 900 mile round trip,
and I drive the car to save gas. I just go without a radio until
I get there. I have dipoles in the trees there, with 100 ft of
coax that I keep rolled up on a tree branch stump. I miss the
radio on the drive, but not enough to butcher up my car. :/

yep. i'm starting to think this may be the case. i've seen tow hitches
used, but this interferes with the hatchback AND, since it's low, the
ground losses are huge

I see that you understand the Faraday's " archaic language ".
You know also that Faraday newer was wrong.
And, "Yes, indeed it does matter who is "writing history."

In a history by S. Errede is wrote: "Faraday inspired by his discovery of
the magnetic rotation of thinks that it might be transverse vibrations of
his beloved field lines"

Is Errede right?

Faraday wrote: " It seems to me, that the resultant of two or more lines of
force is in an apt condition for that action which may be considered as
equivalent to a lateral vibration; whereas a uniform medium, like the
aether, does not appear apt, or more apt than air or water."

For me he wrote: "The resultant of two or more monopoles is equivalent to a
lateral vibrations".

Like the "if its power be shifted for a moment within the mass (neither of these cases being difficult to realise if A and B be either electric or magnetic bodies), then an effect equivalent to a lateral disturbance will take place in the resultant upon which we are fixing our attention.."

What your dipole prodce: TEM waves or "an effect equivalent to a lateral disturbance " ?

you must remember, that just because any of those old guys wrote
something it doesn't mean that they believed it even a year later.
they were all putting up theories and trying to connect electricity
and magnetism with just about anything else for many years. it was
even many years before anyone figured out that electricity and
magnetism were related. you would learn much more by using a modern
text that has filtered out all the theories that were thrown away than
reading the raw conjectures of early theorists.

248. Relative strength: single-wall or nested aluminum tubing?

Newsgroup: rec.radio.amateur.antenna
Date: 2011-02-06 15:58:26 UTC
From: Bert Hyman <bert@iphouse.com>

Source record: 5899

I can find tubing with a .120" wall, and I can find it with .058" wall.

For a short run (just a few feet), would there be any significant
difference in bending resistance between a length of the thick wall stuff
and one made from two nested thin wall lengths?

Weight's not an issue, nor is price.

Interesting design, as it is shorter than a standard ground plane
vertical. Have you built and tested one?

Hi Bert,

Probably not, but what is on either side of this "short run" that
loads this run with stress?

Is this a vertical run, or horizontal run?

reading the raw conjectures of early theorists.

In textbooks are theories with math. Faraday described an ideas.
His idea without an aether and with the electrons seems to be correct.

The rest of my antenna :-) About 25 feet of more aluminum.

It's actually a Hy-Gain AV-640, and the base tube is made of two nested
pieces of .058" tubing, but it's only a foot long, and I'm considering
some mounting options that would require a longer section that I'd have
to make out of stuff I can buy easily.

> Is this a vertical run, or horizontal run?

It's vertical.

it may seem to be to you, but it isn't. look at maxwell's equations,
there is no need for free charge for propagating waves.

Hi Bert,

So it is at the point of maximum leverage - something to consider. As
it is vertical, then wind forces will be magnified at this point.
However, it seems you are doubling the length of what would have been
there anyway.

It still seems robust.

Yes, I have. The one I constructed was for the 70 cm band. I have misplaced the frequency/impedance data I took, but I remember that it compared closely with EZNEC. I did not try to measure the pattern, but I did not notice any dead spots when receiving.

The only thing I don't like is that it is more time-consuming to tune because you can't just chop off the end like you can with the unfolded one.

Hi Bert, I had a similar issue, filled the center of the tubing with
hardwood dowl. The rod I used was for a curtain or closet. I survived
a hurricane and a tornado that took off a good part of my roof. Not
only does it add strength but it keeps the aluminum from collapsing.

It would depend on how you did the nesting. If there's an
interference fit, then it's pretty much one piece of metal.
If it's not, and they can bend independently, you need to figure out
how the loads distribute between the pieces.

In Heaviside's model waves are polarised. It means that the waves are
transversal (rotational vibrations). The medium is a solid dielectric.

In Faraday model the two or more sources of pressure waves produce effect
equivalent to the transverse waves.
In Faraday's electrons no transverse waves. Are such in wires?

I plan to relocate our entertainment system to the basement. At the same time I plan to run cable to the attic for TV and Radio. I would like some advice on what type of cable to run and what types of Antennas would work best from an attic.

Do I need to go buy a radio antenna, or is it just as simple to construct one ?

Thanks'

I've done a variety of schemes like that. A removable bike rack that straps to the trunk lid works fairly well.

I've also built something that clamps onto the towing/tie-down lug. That works pretty well if the lug is in the correct orientation.

A light duty trailer receiver works really well, and when you pull the antenna off, it's very inconspicuous. I did something like this by just bolting a piece of 1x1" square tubing to the bottom of the spare tire well to make a sort of receiver. The antenna mount slides in and it's held in with a couple of removable hitch pins.

pictures (although not very good on the detail you're looking for)

>

Not necessarily.. you can use something that has a lateral member to put the antenna at the corner of the car. Or have a pivot to allow you to swing it out of the way.

As far as the losses go.. just put the base of the antenna (feedpoint) up higher (mount the antenna on a stalk, as it were). You WANT the current in the stalk to couple to the car body. The losses in a few feet of wire to connect the ground aren't a big deal (after all, the antenna itself is just a piece of wire, and the losses in that are presumably acceptable)

One way to think of a mobile antenna is as a dipole with a wire on one side and a very odd shaped ball of wire on the other.

The real thing on the whole grounding thing is to make sure that all the pieces of the car are grounded together, and that your antenna "ground" is connected to a big piece of metal. Bumpers, for instance, are often electrically isolated from the rest of the car by the shock absorbing mounts.

Just and AM / FM receiver.

I was considering:
2x cat5+ UTP
1x 75 coax for TV
1x 50 coax for FM
AM ??

you can normally use the same antenna for TV and FM, and i think most
FM receivers are 75 or 300 ohm inputs anyway. if you really want a
separate one for FM there are simple cheap parallel wire dipoles that
often come with receivers you can just tack up on the wall. AM
receivers probably won't care if you use 50 or 75 ohm, just run a loop
of wire around the attic as far from power lines as you can and that
should be fine.

So I end up with 2 coax cables:
1st coax for TV/FM with an antenna in the attic.
What about a signal amp ? do they really help ?

2nd coax for AM, loop around the attic (how big is too big and should it be parallel or horizontal to the ground ?)

Can I use splitters for multiple receivers, or will this degrade the signal too much ?

using splitters or preamps depends on how strong the signals you want
to get already are. if they are strong enough then you can use
splitters without any problem, if they are too weak you may need a
preamp to boost them before splitting.

you can't make an AM loop too big or orient it enough to make any
difference inside your house, just run it around what is easy to reach
and don't worry about it.

> presumably acceptable)

It will still be fairly lame compared to the whip
mounted on the body of the vehicle. It's not that
ground wires are lossy, the biggest problem is the
lack of real metal under the base of the antenna.
Heck, I once mounted one on a piece of stout angle
iron which was on top of the bed right behind the
back cab window of the truck. I had extra strap
grounding the angle iron to the bed of the truck,
and the whole truck is bonded together.
The antenna was lame. :(I could tell the difference
the first time I use it. When I moved over to the top
of the utility bed toolbox, it came back alive as normal.
He could try it, but I wouldn't be expecting too good
of results. But.. I am spoiled on using good mount
locations, so I am admittedly picky. :/

>
> One way to think of a mobile antenna is as a dipole with a wire on one
> side and a very odd shaped ball of wire on the other.

This is sort of true, but not totally.. It's still
going to act more like a vertical on a poor ground,
than a perverted dipole. One reason I know this is
because no matter what I mount my whip on, it's
resonant frequency never changes much at all.

If it acted more like a dipole, even small changes in
vehicle size and mount location would drastically
detune the antenna to the point it would have to be
retuned a bit. But I've never seen this to be the case
with mine. No matter where on the truck I mount it, or
even if I slap it on a totally different small car,
the antenna tunes the same frequency. That tells me,
it's actually much more like a vertical with varying
qualities of ground, than a dipole with changing lengths
on one side.

I know many claim this is the case, including Roy and
a few others that are quite knowledgeable, but I don't
totally buy it judging from my experiences.
Even when I mounted the antenna on the lame performing
angle iron, it tuned the same place. It just didn't
radiate worth a hoot. When I moved it to the toolbox
with decent metal under the whip, it tuned the same
place, but it radiated much better. One of my trucks
has the whip mounted on the side of the cab, not much
lower than the roof line. It's the best performer out
of all the mounts I've tried. The base is high up, and
the antenna is tall. So needless to say I'm fairly
spoiled. :/

Nothing wrong with that advice, but I think it's most
important to have that big piece of metal under the whip.
It's not going to do much good if it's a few feet away and
connected by wires, or even thick strap. I've found this
out the hard way.. :(But again, I am picky.. And spoiled.
:/

Asking questions is not resisting. Two years ago Richard C. wrote:

"Actually you have mixed up two different characteristics. Polarity
and polarization are NOT the same thing. With RF radiation, the wave
is constantly changing polarity (that is why the source of RF is
called alternating current), but within the "line of sight" of the
antenna, the polarization for a dipole is defined by its angle to the
earth as viewed by the observer.

If you see an horizontal dipole, it produces alternating polarities of
waves with horizontal polarization. If you see a vertical dipole, it
produces alternating polarities of waves with vertical polarization.

RF energy is ALWAYS changing polarity."

Can a monopole produce "polarisation"?

Hello Bert,

If I understand you well, the current tube is a nested construction
(one foot). Considering the overall length of the antenna (25 feet),
the bending moment will slightly increase when changing from 1 to
about 2 feet.

If you believe that there will be more clearance between the two tubes
(w.r.t. the current nested tubes), you may fill the clearance with
epoxy resin. This will reduce the risk on buckling significantly.

Best regards,

Wim

PolariZation.

A vertical monopole is vertically polarized when viewed in isolation
of other reflectors at a distance of many, many wavelengths.

I presume "great" was meant to be ironic. Are you asking how to get a
refund? Simple antennas have ranges into the thousands of miles.

I find it sad that amateur radio operators feel the need to loose respect for each other just because these newsgroups are *mainly* accessed from the internet.

Mention the "internet" aspect of these forums and suddenly people feel it's ok to bash, curse, and make all out war with each other.

I should remind all that these newsgroups are also fed in and out of packet radio BBS stations and read and replied to over RF in nearly all countries utilizing packet BBS's.

Your name calling, cursing and war-ing all go out over the air ways and do nothing to foster and promote the art of amateur radio.

The 'art' of amateur radio?

A bunch of fat, sweaty, socially-maladjusted losers, sitting by themselves in their shacks for hours on end, grousing about how this newfangled interwebnet will never be as useful as the radio they built back in '63 and masturbating furtively over memories of Field Days past?

That's the reality of amateur radio today. As long as there are people like you who continue seeking to use yesterday's technology to solve yesterday's problems, I'll expect more whining along the lines of the above.

Let me spell it out for you: USENET - much like the rest of the Internet - was never intended for transport over amateur radio frequencies. That you (and others) do this is one thing, but pissing and moaning about the content of a medium not covered by FCC or international regulations is, frankly, idiotic on your behalf. Don't like it? Send your own damn traffic out over the airwaves. But don't expect the rest of us to kowtow to your demands.

People wonder why amateur radio is dying. You, my good man, exemplify one reason for that *exceptionally* well.

And, for the benefit of the masses who read USENET via their Icoms, Yaesus, or Kenwoods: FUCK SHIT PISS CUNT DICK BALLS ASS TITS BONER.

That was almost a sentence. Keep trying; perhaps you'll get it right
eventually!

Anyway, I now see why you're so deeply concerned about dirty words on
the Internet making it out over the airwaves:

http://groups.yahoo.com/group/BPQ32/message/3118 (May 1, 2010)
http://www.db0anf.de/app/bbs/messages/show-1239_KG6BAJ (May 3, 2010)

As I see it, this leaves you with two options:

- Fix your filters so that they actually work.

- Stop sending USENET posts over the airwaves.

There you go; problem solved.

Also, I'm pretty sure that I forgot to say 'dildo' in my original reply
to you. I'd hate to think that you missed out on my use of the word
'dildo', so here's a use of the word 'dildo' just for you:

DILDO.

Why? These people don't have internet access?
>
> Your name calling, cursing and war-ing all go out over the air ways and do
> nothing to foster and promote the art of amateur radio.

If that is the case, you are at fault for broadcasting
such content. It's no fault of the internet.
The internet is not amateur radio, and was never
intended to be.
I know myself, I would never broadcast usenet
content over amateur radio, even if it were all
squeaky clean and politically correct.

Packet? People actually still use it? :/
I never saw the attraction myself, but that's just me.
Packet bored me to unprecedented levels of stupor,
even when it was actually a fairly modern mode of
communication.
But even if I used it, I would not transmit internet
content, unless I was relaying important ARRL bulletins,
emergency health and welfare information, etc.
Transmitting usenet? Never.. Ever.. Nada, Zilch..

That is possibly illegal considering you are seemingly not vetting the
content. That would be the equivalent of transmitting porn videos on
70cm ATV and blaming the people who produced the tape/DVD. Moron. I
feel justified on that remark.

> Your name calling, cursing and war-ing all go out over the air ways and do

A 100-mile radius? HOLY SHIT, THAT'S A 200-MILE DIAMETER!

See what I did there? Doubled your range for you FOR FREE.

BUT WAIT, THERE'S *MORE*!

Did I say 200 miles? I must've been coming down from PCP when I did, because I *really* meant THREE HUNDRED AND TWENTY KILOMETRES! That's a number that's 160% *larger* than 200!

Your numbers are now three-point-two times bigger than they were when you started. No need to thank me; just take a shower and we'll call it even.

Has anyone used or tried an antenna like this ?

http://www.g0ksc.co.uk/intro-lfa.html

Called a loop fed yagi. It is mostly a VHF beam where the driven element is a loop. The loop is flat with the boom so it looks similar to an extra element with the ends joined.

There is an example of a 5 element 50 mhz beam. It takes about the same ammount of aluminum to make a 6 element beam. Would this antenna be more of an advantage over a 6 element beam of say the K1FO type ?

Hmmm. It's somewhat similar in philosophy to the "quagi" (Yagi-type directors, with a quad-loop driver and reflector, but I think it's even closer to being a Yagi with a folded-dipole driven element (you can think of a folded-dipole DE as being a very-wide-and-shallow loop).

You can follow a progression of these designs, from a Quagi (which uses a square loop DE), to this "loop-fed Yagi", to a standard Yagi fed with a folded dipole driven element, and then to the WA5VJB "Cheap Yagi" with its half-folded dipole driven element. All of these use the folding or looping of the driven element to raise the feedpoint impedance, which would otherwise usually be well below 50 ohms. The shape of the driven element controls the type of impedance transformation you get.

To be polarized must be the two poles (nodes). Long wire antennas have many
nodes and the directional pattern.
Is it right?

Sadder yet is the fact that the OP doesn't seem to realize that it's the responsibility of the control operator of the originating system to make sure that the traffic is suitable for sending over amateur radio.

And saddest of all is the OP's seemingly random selection of newsgroups, especially when he chose to identify himself as "no.spam@no.spam."

but, but, but, the base is a voltage minimum, not the opposite peak voltage of the top!!! how can that form two nodes to make the electrons jump opposite directions? this just can't be true! this must only be half polarity polarisation.

What? Is this Oliver Twist in reverse polish notation?

"Please, sir, can I have another node?"

Yes, you have fully anticipated an objection in its juvenile form.
This can be countered (after asking for a hand to be held out for
switching):
Pick any potential reference point along the
length of the quarter wave monopole;
every point above it will have the opposite polarity
of any point below it - ergo, two nodes are described
each on either side of the reference.

I hope I don't have to explain that using batteries and resistors (it
may present a challenge in introducing advanced electronic concepts).

Half polarity = no polarity.

The field emission take place where the voltage exists. But at the end the
voltage is doubled (standing wave). So the strong radiation is only from the
nodes.

Such situation is also close to the base. But there no voltage. No voltage
no field emission. On the quarter wave monopole is only one place with very,
very high voltage. The dipole has the two.
>
> I hope I don't have to explain that using batteries and resistors (it
> may present a challenge in introducing advanced electronic concepts).

The "shape" of the node effects the emission. Thin wire radiate in different
direction than a hat .
But in the elongated node every point have the same polarity.

Faraday is great.

so if there is only a single high voltage point at the top how is it
vertically polarized and how does it radiate at all without the other
half of the dipole?

Of course. But the longitudine waves transport mass (electrons) and are not
symmetric. Jumping off is stronger than sucking back.
Tesla discovered the catode rays (electrons) jumping off from the antenna
end. It is the net DC ground current. Why you do not to measure it.
It is known how to collect the catode rays.

You probably have seen the CB radio. On the end of the whip is alternate
high voltage. It radiate the longitudinal electric waves. The other half of
a dipole is chassis (car). Is there any polarisation?

http://www.qrz.com/db/KG6BAJ

That should explain things a bit more - it's really sounding like he's spent a little too much time with the TNC. I've seen this happen before when someone doesn't unplug themselves from the shack.

KG6BAJ, if you're reading this, spend some time away from the radios. It'll help to readjust your perspective.

I've figured this out. :-)

The original posting is from 1995, when people still cared about packet radio
and to many usenet was new and exciting. The reason it took so long is that
it was behind a posting of a shack photo sent as a .BMP (windows bitmap file)
and it took 15 years to be transmitted.

It then ended up in packet to usenet gateway, which added the modern headers.

Geoff.

Dave I agree with you on the evolution from a folded dipole. Wonder
what this design does for gain and F/B. How do check an N connector to
see if you put it together right? Draw any blood lately?

Jimmie

Tesla is not applicable here, an antenna is not a cathode and does not act like one. Neither is it made of a material that is cathodic at room temperature.

So where else does it say the current is asymmetrical?

There sure is. It is typical to see 20dB or so loss when you rotate a
dipole receiving from a vertical ground plane CB antenna from vertical
to horizontal.

From a car it may not be truly vertical because of the body, but it is
still easy to detect.

Field emission works at each temperature and each material. It is voltage
and temperature dependent. Also: "How would the ideal field emitter look
like? It should be very long and very thin, made of conductive material with
high mechanical strength, be robust, and cheap and easy to process."
>
> So where else does it say the current is asymmetrical?

The emission current from AC lines is. But there the electrons flow to
ground. In the lines no open circuit.
In open circuit the voltage is doubled (at least) at the end. If some
electrons jump off than the suction voltage is lower. If an antenna radiate
the VSWR is low = some electrons do not come back.

In the giant Warsaw dipole was: "In the lower half of the mast, there was a
vertical steel tube, attached to the mast's outer structure with large
insulators. This tube was grounded at the bottom, and connected electrically
to the mast structure at half the total height. This technique works by
applying a DC ground at a point of minimum radiofrequency voltage,
conducting static charge to ground without diminishing the radio energy.
Static electrical charge can build up to high values, even at times of no
thunderstorm activity, when such tall structures are insulated from ground.

Guess why the static charge is build up?

The transmmiting "cold catode" is thin and long. It radiate the alternate
electric field perpendicular to its length. Receiving antenna also have the
best direction to collect electrons.
>
> From a car it may not be truly vertical because of the body, but it is

Polarisation is linear, circular, eleptical. Could you produce it by
rotation of monopole?

I did something like that over a decade ago under
A constant impedance antenna system
patent application.
What I did was to capacity couple a dipole arrangement
which I placed very close to a antenna array to get a
constant impedance. The final set up comprises then of two occillators. This coupling
method was picked up by a lot of people
because of its attribute of removing noise via
capacitive coupling. Basically the connecting impedance
point travelled along the length of the feed dipole
which also provided a broader bandwidth with a stable
impedance.

"picked up by a lot of people because of its attribute of removing noise"

Hmm, never heard of it. If it's now effectively spread across the antenna and amateur radio world, pray tell, how does it work? Be specific, give examples.

Bet you can't.

Because never prove anything, ever. No examples with numerical values available. Well, except that weird piece of crap yagi-ish thing you once published here. The "pickup-sticks yagi" Not a particularly good antenna performance wise. Ok, lousy.

You invented a new power plant. But what voltage will be there in fine
weather? In conductor must be the same. Will it be like at bottom or as at
the top or in the middle?

The sentence "when such tall structures are insulated from ground" is wrong.
Should be: "when such dipole works".

try it and see... tie a wire to a kite and fly it up nice and high and
measure the dc voltage to ground. you can also draw current from it.
many years ago i built a motor that was powered by only a wire

sticking up about 20' in the clear air... very interesting free
power! but very dangerous near thunderstorm!

342. Anybody assemble a HyGain AV-640 recently?

Newsgroup: rec.radio.amateur.antenna
Date: 2011-02-15 17:48:40 UTC
From: Bert Hyman <bert@iphouse.com>
Message-ID: <Xns9E8D7827970BAVeebleFetzer@216.250.188.141>
Source record: 5743

I've found either an error in the manual or a defective part.

In the assembly instructions at Task I, step 6, the instructions say

"Insert AV-640 Coil Assembly (LI) 4 inches (10cm) into tubing section
BD."

However, LI can only be inserted 3 inches into BD before butting up
against the smaller diameter tube nested inside of BD.

The overall length of BD is 75" as documented, and the smaller internal
tube sticks out the far end 3".

How did yours go together?

Curious. What are the advantages vs. disavantages of a commercial marine fiberglass antenna such as a Morad vs. using telescoping aluminum tubing sections to accomplish the same?

Of course I realize price is one factor. I'm looking for other factors.

I imagine that weather resistance is probably the biggest. Marine fiberglass antennas are designed to stand up to long-term exposure to salt spray, and salt air.

Anywhere around the coast, salt in the air will eat aluminum antennas for lunch. Unless you're very careful to have a mechanically-strong junction between sections, with some sort of oxygen-and-moisture-excluding goop or grease, you'll end up with serious deterioration of the metal, and a loss of conductivity between sections.

It is all relative!

I have had my problems along the way but it is the best for me that I have found.

If I compile a program without flipping the appropriate switch in Internet Security it promptly deletes the exe because it does not know it!

It was a pain at first, but now I like it. The big problem is the cavelier manner in which Microsoft software is generated.

Norton may be trustworthy. I say that in spite of your feelings
because for my friends who use it, they do not suffer any attacks.
However, they do suffer from its huge resource drain and my friends'
most consistent complaint is how SLOW their system is.

Norton sucks the air out of performance.

Myself, I use Comodo for its firewall (and turn off its virus
detection); and I use AVG (free) for virus detection. I also use
Process Explorer (a very elaborate Task Manager) to look at the system
usage. Even as I write this, my system has 96-98% CPU capacity left
as it should. Any AVG process barely demands more than a quarter
percent CPU cycles.

Shouldnt be a problem, You may want to search for NVIS antennas. I do
a fair amount of camping mostly in the mountins of NC, Ga, TN, VA and
WV. This means camping in the valleys. Seems the NVIS antennas work
better from these locations. Many can also be improvised from local
materials.

One big difference is that the hybrid in a POTS phone doesn't want a deep null. They want enough left of what is called "side tone" to give feedback to the ear with receiver on it. If you don't they are uncomfortable and also think the call has been dropped. It would be in the -10 to -30dB range I'd guess.

On the other hand the null for this antenna array would need to be maybe 90dB or better to be really useful. Maybe with processing it could be done with less, but I'd have to say, I don't know.

Bullshit. I've seen Norton totally fail. I'm an IT guy that repairs this stuff, and IMHO Norton itself is the same as a virus in many respects.

Its not true that 'everyones' suite sucks out performance, but as you say, Norton sure does.

All most SUITE software is nothing more than an in-house firewall that is substituted for the stock MS firewall.

Here we have three (3) antennas, and as we all know they are not in
isolation.

Somewhere, there's a nearby (or near enough) overlooked reflective
surface that disrupts that oh-so-absolutely-necessary symmetry.

That's a fairly close assessment. :/ I'm running Norton Suite here,
mainly because I get it from Comcast. So far, I think it is
doing a better job at blocking terrorists than the McAfee suite
that Comcast used to use. I got whacked pretty bad once when running
McAfee suite, and the byte terrorists bug actually turned off and
disabled the McAfee suite. I finally got that cleared up, but it was
one of the hardest infections to totally clean up I had run across
so far. So far, bang on wood, Norton suite has not let anything through,
and in fact has caught a couple of bugs since I started using it.
I don't find the Norton Suite a constant resource hog, actually very
low most of the time. But.. I sometimes notice short term slowdowns
when it's doing one of it's processes. IE: new sig downloads, scans, etc..
Sometimes I'll see it when watching a movie. It will freeze or jitter
my video for a second, then the load idles back down. It never lasts
longer than a second or two. I've always assumed Norton was causing that,
being as there is no other real reason for it. And I'm running a quad core,
so no real lack of horsepower to keep up with the video.

So I can tell something pulls a momentary hard load every once in a while.
I used to use AVG, but quit for some reason I can't even remember..
Seems they went to a new version or something and I decided to switch to
the suites being as I get them pseudo free from Comcast.
But in the overall scheme of things, the puter runs the same as it
ever did.. No constant slowdown at all.
Right now I've got 9 browser windows open, mail, Windows Explorer file
manager, and still idling along at an average 1-2 % CPU use.
You can see some spikes, but a lot of that is moving the mouse, etc..
So far, bang on wood, nothing has been able to whack me since I have
been using the Norton Suite. I'm sure there is always a first time though. :(
I never feel totally invincible no matter what I'm running.

many years ago i built a motor that was powered by only a wire
sticking up about 20' in the clear air... very interesting free
power! but very dangerous near thunderstorm!

In clear air the electrons migrate up. Under a cloud down.
The direction of DC is weather dependent.

Of course sometimes no DC at all.

It is interesting that a wire sticking up about 20' produces DC but your
antennas no.

Transmitting antenna is like electron gun.

SB,

If electrons leaving the antenna are what makes it work, then please explain how an antenna coated by an insulator like plastic or fiberglass works.

Thanks,

Yes, everything can fail. I cannot forget the time when a Norton update shut me down. It was a long ways back and I don't remember the details, but it was not pretty.

I am an old retired guy who has fallen into the trap of maintaining a few family and church machines. Usually on my funds and always on my time. Since I have a lot of more interesting stuff to do I like to keep things simple as possible for me. Norton has 3-user packages that are available on sale from time to time and I am the only one that notices the performance hit. The background scans seem to be the worst offender for me. I tend to run too many browser windows open at any give time. Saving & restoring Tab groups has helped a lot there.

It is a good time for an old geek to be retired. Information is widely available and lots of good guys to communicate with!

BTW and even further off topic, my clothes washing machine failed early this week. I found a wealth of service info on YouTube which saved me about $500! I will take me a few days to recover from the physical efforts but it has been a very satisfying week!

Hopefully I will get some maintenance done on the tower this coming week and get back to antennas...

Permittivity is material and frequency dependent. The space and an insulator
like ice and plastic or fiberglass have small value.
Water has 81.

An antenna covered with ice works. But if the ice is melting and the all
pores are filled with water the antenna do not work.

The key issue is the net DC current. Of course as a result of ansymmetry.
More electrons flow up then come back.

This net result is easy to measure.

It was here about antennas made of salt water.
Is it a normal practice to make an underwater antennas?

yes, there are underwater antennas in use 24/7 by military
submarines... so how do the electrons get through the salt water?

They don't. Radio waves travel through water the same way they travel
through outer space. Albeit better through water at ultra-low frequencies.

I don't see where you explained anything about the electrons. The
article doesn't, either.

I'll repeat the question in case you forgot it again.

"so how do the electrons get through the salt water?"

And of course then we have the problem of RF communications with people
who are in caves.

How do the electrons get through the dirt? Which seems to be even less
likely than salt water.

Having not read most of the nonsense that attends this kind of side thread, I will dip my oar into this anyway and ask:

How do the electrons get through the air? (especially when, in their ferocious struggle, they usually light up the night with corona in the best of worst performance that rarely achieves propagation beyond an inch).

About 25 years ago, I attended a conference on design methodologies for blanking continuous (or high duty factor) signals in a military environment. The benefit is to eliminate interference by your own transmit signals to receivers, especially wideband EW/ECM receivers. No discussion of twinned transmit antennas, though, but sample-and-cancel techniques were prominent. Big problem: maintaining phase linearity.

Asymmetric molecule oscillations = sound waves.
Asymmetric electron oscillations = electric waves.

On that page are radio waves in air and water. Free electrons are
everywhere. But the freedom is material dependent.

In Nature are the continuous flows and the oscillatory flows.
The oscillatory flow is a second name of waves. If oscillations are
asymetric than net flow take place.

Electrons are everywhere. Their freedom is material dependent.

<sobars@cox.net> wrote:

>Big problem: maintaining phase
>linearity.

I was on duty aboard the USS Holland (my job, heading up the standards lab) when one of the submariners rousted me out of my rack to make a measurement - the last one before the captain could go out to sea.

I tumbled down the ladder (sometime in the early AM) to find a group of techs huddled around a meg-Ohmmeter in the main passageway just aft of Sherwood forest.

Now I add that significant detail because, as you mention about maintaining phase linearity, every time a sailor shimmied past the group to go forward, his movement would peg the meter in one direction or the other. The guys were trying to measure a gigohm load in the nuclear reactor. The disturbance of the local electric field was enough to drive the resistance bridge wild. Any movement in its vicinity was enough to do that. There was barely enough patience among that group to let anything settle.

The sub couldn't move until they got at least 1 Billion Ohms, and when I asked what the problem was (I was the pro from Dover there to rescue their butts or the captain would keelhaul them), they said they were several magnitudes of order off - too little resistance.

I hunkered down over the instrument, waited a couple of minutes before the static fields settled and the instrument calmed, and I measured AT LEAST a gigohm. "So what's the problem?"

"We need a billion ohms before we can certify the reactor is ready to get underway!"

I looked at my measurement - easily a billion ohms, 1 gigohm (I thought there wasn't that much resistance between us and the moon, but I wasn't going to make that observation with the XO hunkered down watching this, and the Old Man staring over his shoulder.).

"No, No! A BILLION OHMS!" came their plea when I pointed out the measurement.

"What do you think a billion is?" I asked.

"We looked it up in the dictionary and its a million million."

I stood up and looked forward to crawling back into my rack. "That is the English definition for billion. What you want is the American definition for a billion which is a thousand million."

To measure it you must have an equipment and good will.
The last is more important.

Look at the original Hertz apparatus:
http://people.seas.harvard.edu/~jones/cscie129/nu_lectures/lecture6/hertz/S_p11.gif

To have one portion of radiation it is enough to charge one half of the
dipole. Charging is made with DC.
After some time you can repeat it.

The radiation is in form of the damped wave:
http://en.wikipedia.org/wiki/File:Ondes_amorties.jpg

In damped waves each amplitude is smaller than the previous. So in one cycle
no symmetry.

It is obvious. But you can try to detect it.

I do not know. It is peak voltage and efficiency dependent.

If electrons jump off from antennas it will be easy to measure in klystron:
http://en.wikipedia.org/wiki/File:Klystron.enp.gif

The electron beam is collected after work. If starting beam is equal to
collected then no jump off.

Cross-posted to: rec.radio.shortwave,rec.radio.amateur.antenna

"...most people that are creative people...are pretty much different from the average person, they don't think the same way, they're not motivated by the same things and...they're usually very very difficult people to get along with. ...they're not like you or well most of us." [The Summer of 2010, 3840khz (2:30 in the morning), Comment from Jim (KI6GU) A rare qso on worldviews].

"Just relax a little bit...c'mon Kevin. Ya know laid there four days on the floor, ya know and you're alive. Ya gotta be thankful for that. C'mon man, if somebody at your work didn't have a reason to care about you a little bit. You wouldn't be here with the rest of us. Now you gotta be thankful for that c'mon. Lotta people have their problems and have their issues in life. Everybody's not the same mold, everybody's different, everybody's built different, everybody has different wants and needs. Some people need somethin' to hang on to too make 'em feel better. Or people...ridicule other people because they don't feel good of themselves unless they do ridicule someone. Just c'mon...man. Just relax." [The Summer of 2010, 3840khz (2:40 in the morning), Comment from John "Cosmo" (KI6VPR) to AD8Q on cooling Kevs nerve because somebody did not identify].

Jim's comment from the summer of 2010 (Tom sat back on this qso) alludes to the youthful mindset of, shortwave maven, Tom Gleeman's (KE6YNH), friendly personality gift. One of the nicest ham operators to operate from the Pacific shores. Tom has passed on from a massive stroke at the age of sixty Feb. 12 2011. (see source)

Tom Gleeman was one of the original founders of the late morning frequency rag chew - on 3840KHz, one created by the semi-retired broadcaster Art Bell. I will never the first time I tuned in and found Tom and Kenny (fondly known as the Llama Man (KG6HKM) in a 2AM qso, anybody's who was fortunate to hear Tom and Kenny in a solitary qso, were reminded of the characters from Cervantes novel "Don Quixote". Odd confessions like Tom admitting that in all the years living in San Diego "he never surfed but only boogie boarded [with his spontaneous chuckle]", exemplified his earthiness. Both Kenny and Tom in qso were classic examples of rag chewers. I will never forget Tom's "Annnnnnyway" punctuation and his distinctive youthful sign "This is Tom innnnnn Sannnnn Diiiiiiiiiego" .

Tom was proud of his Chinese pen pal girlfriend, a knowledgeable Trekkie, loved his dog (who got stuck in the dog door), his cat, hated the 500 pound concrete table that rusted in his back yard, and was very grateful to the American Radio Relay League (ARRL) in

addition to respecting the old dogma of shortwave communications,
he lived life to the fullest.

In the last seven months his probing conversations that at times were
taken out of context. In all sincerity, and from I what I've heard from
his qsos, his so called, contorting statements occurred when he started
taking pain killers. Somebody on qrz.com noticed the subtle change too.
Tom was more like a moderator, keeping other hams at bay from killing
each other, but at times he would rather lay low through the occasional
war zone that would erupt on 3840kHz.

Somebody at the qrz.com obituary commented Toms fondness for calling
cq. "This is Tom calling cq, calling cq, this is KE6YNH calling cq"
sometimes I heard him do that for 10 minutes and usually he'd get a
response. Right around Christmas of last year Tom commented that his
earliest memory when learning about ham radio was "he always wanted to
call cq" and was amused when he roused a senior ham from his sleep who
chastised him "Don't ever call CQ. It is a thing of the past." Always
grateful to make making a contact he acknowledged ham operators from
the East Coast of the United States, the Midwest, Alaska, Canada, South
Africa, Hawaii, Australia, New Zealand, Mexico, Central America, Japan
and Costa Rica. What was interesting about Tom's personality, he
admitted that he would sometimes talk with non licensed operators who
were respectful and had something to say. That was so cool and
represents the young'un hams who did eventually get their tickets
because of Toms encouragement.

Let us now celebrate Tom with two nice musical selections.

Shelly Y Nueva Generacion - Vestido Azul [1966]
(http://www.youtube.com/watch?v=9bRTq3t7q0U)

The Staple Singers - Be Careful of the Stones You Throw [1964]
(http://www.youtube.com/watch?v=vBthgVHdy0g)

A moment of silence was called at Feb 18, 2010 2:29 A.M. (PST) on
3840Khz by a stellar group of fellow hams.
My condolences to Toms survivors.

Been done.
Adaptive cancelers for co-site interference have been around for
decades. A friend of mine used to work for American Nucleonics Corp
(there's a company name from the 50s, eh) in the 80s, when they were
transitioning from totally analog cancelers to digitally controlled
cancelers (with the canceling still done in analog, with a second antenna)
The idea of two transmitting antennas forming an adaptively canceled
null at the receiver has certainly been mentioned in the literature.

Field emission is voltage dependent. What is the voltage peaks on the end of
your antennas.
Even if they are symmetric the emission is different for negative/positive
voltage. The negative emission is stronger.

Put on CB antenna the cathode ray trap (vacuum tube) and measure the
anticathode to ground current.

All practical systems like this use some form of adaptive logic to fix
that. Usually, adaptive canceling is done in the receiver, because the
signal levels are lower, but in the 802.11 kind of world, with 100mW
linear transmitters, there's probably not much cost difference.

A different matter if you're running a kilowatt.

how can it be voltage dependent if it is necessary for the rf signal?
do qrp signals that only generate 1v on the tip of the antenna not
generate rf waves and propagate??

It only takes a couple of milliWatts (kiloWatts aside) to ruin your
day in competition for listening to microWatt signals. The desired
signal's transmitter antenna would have to be literally within the
near field of the active transmitter (and receiver's) antenna system.
At that point, we may as well use a land-line with hybrid bridges.

Software coming to the rescue for a hardware problem works only in
multi-million dollar projects (fly-by-wire avionics comes to mind).

In these sorts of systems (the ones alluded to in the original news story), all the signals are in one FPGA (in digital form) and the powers are fairly low so all the RF stuff runs basically linear (DC to RF efficiency isn't a huge deal on a 50mW transmitter next to a 10 Watt FPGA)

So it *is* a wireline hybrid bridge.. but done with numbers instead of transformer windings.

The point I was getting at is that in these MIMO systems, there's already multiple receive and transmit channels with substantial signal processing going on. So it doesn't really matter much whether you do the cancellation/null forming in the Tx or Rx side. If you can do some clever canceling with Tx, and make it possible to use a cheaper Rx (or, run full duplex without needing huge dynamic range/linearity in the Rx) then that's probably a net good.

The technique proposed is very, very similar to one used to create increased stereo separation ("headphone sound") from conventional stereo speakers. You send a part of the Left channel signal to the right

speaker that just cancels the signal arriving at the right ear from the left speaker. It's a very, very impressive effect.

Hi OM,

I especially like your coverage of your antenna from I3VHF.

On your second page, unfortunately, you have some misconceptions about
loop antennas.

All antennas exhibit the same noise characteristics. If you erected
a conventional (electric) dipole in the same space, it would exhibit
the same characteristics.

It is quite curious how you describe a front/back ratio for a dipole
(the loop is a magnetic dipole, and as such "should" show a
conventional dipole pattern).

As for loop efficiency, you state:
"When a magnetic loop antenna is used for
3.5 MHz with a perimeter of 4 meter (13.3 foot) ,
it has an efficiency of approximately 3%."
Please show the math.

This seems to be straying from what this is about: an antenna system.
You seem to imply that the 10W FPGA is a source of radiation to
confound things. How that arrived, I don't know.

The presence of uncontrolled reflecting surfaces in proximity to the
antenna system is the objection, and the introduction of unintended
out-of-phase reflection transmission signals combined with intended
receive signals present at the receiving antenna yields the classic
problem of S+N/N degradation.

>So it *is* a wireline hybrid bridge.. but done with numbers instead of
>transformer windings.

This does not answer the objection. Reality (conventional usage) will
bring these corrupting out-of-phase signals and the best that software
can offer is a regression of retries to obtain error corrected packets
sorted out a the cost of seriously depressed through-put rates.

This "invention" is more about being clever than useful and belongs in
a museum case next to the Babel Fish (whose utility is questionable
when you have to listen to Vogon poetry).

Hi Richard,

Thank you for your reply and your interest in my homepage. I will answer your questions between the lines.

I will use the remarks that I get to improve the content of the article on my site.

I agree that they are electrically equivalents. However, my point is that the magnetic loop has useful benefits over the dipole antenna for RX under certain circumstances. I believe the magnetic loop construction will in many cases deliver an acceptable signal at the receiver with less disturbances such as atmospheric noise.

About external noise sources:

The loop is smaller (less surface) and therefore picks up less static noise. The dipole covers a larger area in which there can be sources of noise.

The pickup loop that connects the coax to the loop antenna is isolated from the antenna and it forms a shortcut for DC. The signal transfer is inductive.

The magnetic loop tunes to the frequency and there is no external antenna tuner needed.

About intenal receiver noise and mix-products:

The magnetic loop in itself is a band pass filter at the source of the receiving signal. It eliminates strong signals outside the received frequency. Therefore the receiver can receive the wanted signals with maximum sensitivity. The band pass functionality of the loop protects the radio from overloading. And as a result of that the radio will be quiet and doesn't need to pick a weak signal from an overloaded band. The bandwidth of

the I3VHF is very small in the 40 m band. AM modulation is not possible as the bandwidth of the loop is too small here for passing a standard AM signal. The signal will be clipped and the transceiver react to that which can be seen on the SWR meter. SWR starts to alternate on the rhythm of the modulation. The bandwidth of the antenna gets larger in the higher bands. I believe that in the 40 meter band the I3VHF only lets trough one frequency in SSB. The receiver is almost mute tuning higher or lower.

As for receiving the readability is more important than signal strength. The lower RX signal from the magnetic loop is often more readable than when using a full size dipole at ideal height. I think that the advantages are best in the Low bands, e.g. 80, 40, 30 meter.

For TX there are advantages of the magnetic loop over the full size dipole. When one has shortage of space. The high small band pass filter that the Magnetic Loop is, makes the radiated signal free of harmonics. Therefore there is a smaller chance of rfi to be expected .

Maybe some of the points here are not based on solid scientific research. But it is what I found doing experiments with the loops.

> It is quite curious how you describe a front/back ratio for a dipole

The data is based on the specifications of the manufacturer of the I3VHF loop antenna.

http://www.ciromazzoni.com/English/Loop%20Antenna/Loop%20Baby.htm

In the manual, page 42, 43 there is a picture of the radiation pattern:

http://www.ciromazzoni.com/English/Loop%20Antenna/Manual.pdf

It also surprised me as I expected a dipole pattern.

The 3 % efficiency is hypothetical based on the outcome of calculations software that is available on the Internet.

For example the loop calculation software of G4FGQ.

triboelectric charging can result in you being positive or negative...
and is not related to IR radiation you are emitting all the time. lay
still flat on the ground and you will not be triboelectrically
charged, but you will be constantly radiating IR radiation.

Hi Norbert,

Demonstrable proof shows otherwise.

>About external noise sources:
>
>The loop is smaller (less surface) and therefore picks up less static noise.

Static is indistinguishable from the RF you want to hear. In other
words static is RF, signals are RF. If your small loop picks up less
of one, it picks up less of both. However, this "picks up less" is
arguable.

>The dipole covers a larger area in which there can be sources of noise.

Reread my statement: "If you erected a conventional (electric) dipole
IN THE SAME SPACE."

>The pickup loop that connects the coax to the loop antenna is isolated from
>the antenna and it forms a shortcut for DC. The signal transfer is

This is a tautology, not a reason.

>The magnetic loop tunes to the frequency and there is no external antenna
>tuner needed.

Here, the Q of the tuned loop DOES contribute to less interference of
out-of-band signals. It does not reduce interference to in-band
signals. Noise is not specific to frequency, although single
frequency emitters can be called noise (unwanted).

Barring problems of lacking a choke on your control line introducing
SWR issues, I would tend to agree.

You have a lower signal because you have a lower antenna. Let's not
turn a deficit into a glowing recommendation - especially when you go
to transmit you lose that same gain from low height.

>For TX there are advantages of the magnetic loop over the full size dipole.
>When one has shortage of space. The high small band pass filter that the

A small (electric) dipole is identical in characteristics. It simply
doesn't come built with its own tuning mechanism.

Your arguments are not about antenna, but tuning.

I presume this is for the MIDI loop with a 2M diameter. The claim
offered is that it exhibits a Q of 1500 at 3.5MHz. The radiation
resistance for that size of loop is 0.49 Ohm. So, if 3% of the power
goes to 0.49 Ohm, then 97% of the power must go to heating up the
large tubular structure's Ohmic resistance (which would be very high,
and quite remarkable for that mass). Let's consider that you took an
Ohmmeter and measured half an Ohm in the structure, then you would be
losing only 50%, not 97%.

If you short your Ohmmeter leads together, I bet they have less than
half an Ohm resistance, why should this massive structure have more
loss than simple wire?

The argument would also have to answer the high Q (that much loss is
very low Q).

>For example the loop calculation software of G4FGQ.

Give us the entry data and the formula.

Excellent thinking. If I am laying on the ground I constantly pump electrons
from the ground into the air without being charged. Exactly like your
transmitting antennas connected with the ground or chassis. Without
connection to ground they becomes positively charged.

Are you able to measure the static voltage of a human skin?

EM wave static is indistinguishable from RF waves. Pstatic, for
instance, is not caused by EM waves and is therefore, distinguishable.

The bandwidth is so narrow in the 40 meter band (I3VHF) that only a few kHz
so there is a smaller chance of strong out
of band signals.

By the way, having to tune the loop every time when changing frequency is a
mayor disadvantage of tuned magnetic loops. The MFJ loop can be tuned rather
fast and the larger bandwidth makes it easier to hear within several kHz
from the tuned frequency.

I don't think that it's just a matter of height. But maybe you are right. I
can't put up a full size verticale on my balcony to compare.

A magnetic loop will work indoor and outdoor. Low on the ground and high in
the sky. And without a counterpoise. Dipoles require space. Verticals
require counterpoise. When there is little space or other restrictions the
loop is a nice alternative.

For transmitting a magnetic loop can be also interesting when there is no
space for a full size antenna.

One could also for example use the full size antenna for TX and the magnetic
loop as an
alternative for RX.

It's not that I'm against dipoles because I reviewed some magnetic loops. I
appreciate the concept of the magnetic loop. I would use a dipole with open
feeding line and symetric tuner where possible.

Hi Norbert,

Usually in the first chapter of any college text on antennas.

>Precipitation Static (p-static) can be different.

An electrical discharge that is harmonic rich still qualifies as RF.
That pulse electric discharge is going to create a pulse magnetic
field. Guess what? A magnetic antenna (as a loop is often described)
will pick up that field as readily as an electric antenna.

>The bandwidth is so narrow in the 40 meter band, only a few kHz.

These are operational characteristics of a tuned loop. Look at your
own subject heading: Magnetic Loop - not the same thing.

In fact, the term Magnetic Loop is an invented term. RF is both
magnetic and electric simultaneously. All antennas respond to both.
Your tuned loop exhibits astronomically high electric potentials.
Would you care to guess how high the potentials are for receive as
compared to the field potential it experiences?

Let's put some fantastical numbers to this last question. A reception
field of 1V/M will exhibit ______ V on the capacitive elements of a
resonant tuned loop with a Q of 1500.

A 2 meter wide dipole occupies less space than a 2 meter wide loop.
Once the dipole is matched, performance will be identical.

You could as easily say the same for a full size loop. Do you notice
any irony?

Actually, you need to do this yourself as these are all your choices.
This is your offered explanation and your offered testimony. In fact,
in this, a technical forum, there is every expectation that you could

reasonably perform these technical matters and respond with results.
Do you have an Ohmmeter? Are you proficient in its use?

If you cannot on your own, and without prompting, reconcile 3%
efficiency with a Q of 1500, then you shouldn't be offering technical
advice about Q or efficiency.

>>>For example the loop calculation software of G4FGQ.

I have corresponded with G4FGQ the software designer for YEARS.
Consult the archives. I understand how it works. The question was
for you to write what YOU did, and not what someone else might do.

Hi Richard,

Thank you for the explanations. I have not had the intention to start a scientific discussion here on this subject. To me it is a hobby. With my homepage I just want to share some of my experience with magnetic loop antennas, just like many other radio amateurs do. And of course I am willing to reply to reactions from readers. But I will not further discuss about scientifically details.

Thank you.

Best Regards

73,

Norbert PA7NR

No.. the original article was talking about low power 802.11/802.16 systems (which radiate less than a watt).. At that power level, the fact that a suitably good linear amplifier is going to consume a fair amount of power (20% efficiency would be doing well) is insignificant next to the power consumed by the digital processing necessary to implement the cancellation algorithm.

No.. I would expect that this would actually work fairly well. The idea is to allow full duplex operation, rather than the current half duplex used in, e.g., 802.11b/g. That would double the throughput (if traffic on the network were symmetric).

If you want to run full duplex, you have to have some way to "see" the received signal in the face of a much larger transmit signal. Since you're transmitting, you've got a copy of the transmit signal, so it's really a matter of figuring out what the transfer function is from transmitter to (self)receiver. If the external environment were fixed,

then one could probably do it with a coupler with adjustable gain and phase. However, as you point out, the environment isn't constant, so you need a way to adaptively adjust. You could do it with a single transmit and single receive antenna, but that puts a tough dynamic range requirement on the system. Say, -20dB coupling from Tx to Rx antenna, +30dBm on transmitter, -100dBm received signal.. you need 110dB instantaneous dynamic range.. that would need a 18-20 bit converter, which doesn't exist at a reasonable price in the 10-50 MHz sample rates needed.

The idea of using a pair of transmitters to reduce the dynamic range requirement on the receiver is clever. I would think you could get 40dB suppression without too much trouble, which gets your instantaneous dynamic range requirement down to 70dB, which is starting to be in range (there are inexpensive fast 14 bit converters, for instance)

I agree with ka7niq. Open wire is the only way to go. I'm using a 135
foot dipole with open wire and it works great.

Your loop is not magnetic. Look at Fig. 2:
http://www.antiquewireless.org/otb/lodge1102.htm

Radio wavesare are radiated from the nodes. In dipole the nodes are created
by reflected wave (waves in the opposite direction). In the loop the waves
travel in oppsite direction and create the nodes also.

Verticals work like the Kundt's tube. Dipoles like the two Kundt's tubes.
A loop is like a dipole where the reflected wave is replacesd by the on from
the second wire.

Hertz has the dipole and the loop:

well, you go ahead and measure it, and take a picture of the
asymmetric waves while you are at it... once you publish in a peer
reviewed journal i'll start talking to you again, this is getting
rather boring since you refuse to learn.

i am referring to a theory from around 1880 that had a sea of
electrons as the aether for propagating electromagnetic waves.

It is from 1846: http://www.padrak.com/ine/FARADAY1.html
Faraday wrote:
"I suppose we may compare together the matter of the aether and ordinary
matter (as, for instance, the copper of the wire through which the
electricity is conducted), and consider them as alike in their essential
constitution; i.e. either as both composed of little nuclei, considered in
the abstract as matter, and of force or power associated with these nuclei."

Aether and a sea of electrons (as the rare plasma) is not the same.The other
scientists needs a mystery aether where a strain, stress and flows take
place. Faradays electrons vibrate.

my em waves are made out of energy not paper... while Einstein says
they are interchangeable my radio would have a hard time receiving
paper.

Change "sea of electrons" to "quantum soup" and the aether theory is
alive and well. Even photons need a structure through which to
propagate.

Actually the "P-static field" originates directly from electrons while
the EM field originates from photons. What a closed loop does with
those excess electrons is quite different from what a single-wire
dipole does with them. All points on a well-designed loop system have
a path to ground in addition to the signal path. That's not true for a
single-wire dipole. From 1/2 of a dipole, the signal path is the only
path. That's why undischarged dipole systems can arc during conditions
of P-static while loops don't arc. Wouldn't you say that an absence of
arcing is less noisy than the presence of arcing?

In a dipole, the reflections are naturally from the impedance
discontinuity at the open ends of the dipole. In a loop, the
reflections on the antenna are from the impedance discontinuity at the
feedpoint.

On the contrary, a quantum soup is indeed required. If photons could
propagate without a structure, they could exit the universe but they,
like us, are trapped and confined to the universe.

Hello Richard,

I agree with you that several statements on Norbert's site will not hold when scientifically reviewed. However I think the way you respond will likely not result in better statements.

As the name of the newsgroup indicates; this is a radio amateur group and Norbert site starts with "Dutch amateur radio station". This may require another approach then you should use in a professional environment. If you prefer that, Edaboard.com (just an example) is a more suitable place.

Now the result is a professional reaction of Norbert:

> Thank you for the explanations. I have not had the intention to start a
> scientific discussion here on this subject. To me it is a hobby. With my
> homepage I just want to share some of my experience with magnetic loop
> antennas, just like many other radio amateurs do. And of course I am willing

> scientifically details.
>
> Thank you.
>
> Best Regards
>
> 73,
>
> Norbert PA7NR

Because of rain, I had to stop some activity so I took a pocket calculator, some of my own course material and a used envelope within reach.

A loop with diameter = 1.27m (4m perimeter), made from 20mm (diameter) copper has an inductance of about 3.4 uH (reactance of about 77 Ohm at 3.6 MHz).

Radiation resistance (no coupling with other objects) will be about 1 mOhm.

AC copper resistance due to skin effect will be about 30 mOhm (based on uniform current distribution over the circumference of the tubing).

Q factor should be in the range of 2500
Radiation efficiency will be about 3%

Directivity is 1.5
Voltage between ends (100W input): 6.3 kVp.
Current through loop about 82 Ap

A half wave dipole will have about 1kVp at each end (depends on conductor thickness).

Effective area of antenna will be about 23 sqm (in free space).

1Vrms incident plane wave field (2.65mW/sqm) will result in about 61mW output power (about 150Vp across the tuning capacitor).

You probably know that measuring a lower Q factor may result in less overall efficiency (coupling to dissipative objects) or higher overall efficiency (coupling to metallic conductors that reradiate).

With kind regards,

Waves need medium to propagate. Some scientists prefer mystery aether some
ordinary matter. Faraday and Ludwig Lorenz were sure that in space is enough
mater and no mystery aether. Now everybody know that in space is ISM (rare
plasma + dust). It is ordinary matter (electrons, ions and dust). But radio
waves will be always the aether waves. So we also can say that aether
consists of ordinary particles.

I do not understand. A loop can be made of wires without any discontinuity
at the feedpoint. Pulses send from supply must collide in the loop. The
nodes appear like in a dipole but without reflections. For what you need
reflections in a loop?

It depends upon how one defines "ordinary". The structure of free space has existed since the big bang but man has only recently discovered the structure and is still somewhat ignorant of its configuration and characteristics. There is some evidence that the structure of space in which ordinary non-dark matter and non-dark energy exists, is made up of dark matter and dark energy.

> I do not understand.

A loop, like a dipole, is a standing wave antenna with a characteristic impedance in the few hundred ohms, e.g. 600 ohms. The reflections on a standing wave antenna have to originate from an impedance discontinuity. The feedpoint impedance of a standing wave antenna is Zfp = (Vfor + Vref)/(Ifor + Iref) where phasor math is used. Let's assume that the feedpoint impedance is 100+j0 ohms and the antenna is being fed with Z0=100 ohm feedline. There are no reflections on the feedline which means a Z0-match to 100 ohms exists at the antenna feedpoint. Assume the characteristic impedance of the antenna wire over ground is 600 ohms. The 600 ohm to 100 ohm impedance discontinuity at the feedpoint creates a reflection coefficient of 0.7. That's where the reflections on the standing wave loop antenna are coming from. One reason the feedpoint of a resonant loop is higher than for a 1/2WL dipole is that the reflection coefficient for the loop is 0.7 while the reflection coefficient for a dipole is obviously 1.0 at the ends of the dipole.

The concept may be easier to understand using a rhombic example. A terminated rhombic is terminated in the characteristic impedance of the antenna wire above ground, e.g. 600 ohms, which eliminates reflections on the antenna and turns it into a traveling wave antenna where the feedpoint impedance of the antenna is equal to the characteristic impedance of the antenna over a wide frequency range, i.e. Zfp = Vfor/Ifor, independent of frequency.

Removing the termination turns the rhombic antenna into a standing wave antenna and the feedpoint impedance becomes Zfp = (Vfor + Vref)/(Ifor + Iref), i.e. the feedpoint impedance is frequency dependent like other standing wave antennas.

I built one of those about 20 years ago to be able to hit the local repeaters, coverage was a little disappointing. going to a 5/8ths with 5/8ths radials made a noticeable difference and was nearly as easy to fabricate. The base of it with radials still adorns my chimney.

Jimmie

Curious combination of conflicting sentiments, there. What is
suitable, and how should we recognize it?

>Radiation resistance (no coupling with other objects) will be about 1
>mOhm.

There are many source for computation, I chose one that closely agrees
with several at hand. Perhaps I made an entry error, so I will take
the opportunity to examine that possibility here:
Rr = 80 ï¿½ piï¿½ ï¿½ (dl/lambda)ï¿½
80 ï¿½ 9.87 ï¿½ (2/80)ï¿½
790 ï¿½ (0.025)ï¿½
790 ï¿½ 0.0006
0.49 Ohm

Of course, the possibility of mis-entry remains, and cross checking is
helpful given an in dependant validation. If I examine my text
further it uses as an example a smaller loop at a lower frequency
dl = 1m
F = 1MHz
(lambda = 300)
resulting in
Rr = 0.0084 Ohm
which is roughly 10 times your computed radiation resistance for a
larger loop at a smaller wavelength.

Now, having said that, and examining my text for further possibilities
of error, I find that, yes, I made an error. My computation was based
for an electric dipole, not a loop. Let us examine the Rr for a loop
from the equation from the same source:
Rr = 320 ï¿½ pi^6 ï¿½ (r/Lambda)^4
320 ï¿½ 961 ï¿½ (1/80)^4
307,645 ï¿½ 2.44^-8

0.0075 Ohm
This, too, is very different from your calculation, but certainly that error is eclipsed by my own first reckoning. However, what does this say about efficiency based upon the original design (but computed for another)?

However, I did first ask Norbert for the equation used and the parameters entered. Testing those results did not appear to be appealing in the face of contradicting testimonial. It should come as no surprise that many testimonials are tested here. Testimonials stand or fall in such tests, and those tests are retested (as has given rise to this and your response).

Curiously we entered into this with how the loop has superior qualities over the standard dipole, and then the same loop is cited as being very inefficient. How such contradictions are held within the space of a short thread is certainly a denial of engineering professionalism, but denial is not the standard of merit that is typically lauded in this forum. A hearty defense of wounded ego raises suspicion even further.

One consequence of that demurral brings us to a rather remarkable insight in comparing the radiation resistance of the electric dipole to the loop within the same spread of the loop (and in certainly a smaller volume of space). The electric dipole enjoys 60 times more radiation resistance that certainly impacts efficiency to the same degree. This, of course, presumes no further errors in computation or application.

And there is the nut of contention. Software will have to accommodate
to variation in environment and throughput suffers. This is old
stuff. The magic of computation still admits of cost galore. More
money for poor transfer doesn't add any sparkle to market
possibilities.

How much is "a little extra"?
Is that the cut length or length through the holes?
If not, length measured from where on the TNC connector?
Is the driven element the same length as the ground plane elements?
Hint: They're usually not the same length. For example:

>It depends upon how one defines "ordinary". The structure of free
space has existed since the big bang but man has only recently
discovered the structure and is still somewhat ignorant of its
configuration and characteristics. There is some evidence that the
structure of space in which ordinary non-dark matter and non-dark
energy exists, is made up of dark matter and dark energy.

I prefer this: "It seems to be a natural consequence of our points of view
to assume that
the whole of space is filled with electrons and flying electric ions of all
kinds. We have assumed that each stellar system in evolutions throws off
electric corpuscles into space. It does not seem unreasonable therefore to
think that the greater part of the material masses in the universe is found,
not in the solar [sic] systems or nebulae, but in 'empty' space" (Birkeland
1913).
Thorndike (1930) noted that "it could scarcely have been believed that the
enormous gaps between the stars are completely void. Terrestrial aurorae are
not improbably excited by charged particles from the Sun emitted by the Sun.
If the millions of other stars are also ejecting ions, as is undoubtedly
true, no absolute vacuum can exist within the galaxy."

A loop antenna' is a radio antenna consisting of a loop of wire or other
conductor with its ends connected to a two-wire transmission line. They have
a radiation pattern similar to a dipole antenna"

>> I do not understand.

>A loop, like a dipole, is a standing wave antenna with a
characteristic impedance in the few hundred ohms, e.g. 600 ohms. The
reflections on a standing wave antenna have to originate from an
impedance discontinuity. The feedpoint impedance of a standing wave
antenna is Zfp = (Vfor + Vref)/(Ifor + Iref) where phasor math is
used. Let's assume that the feedpoint impedance is 100+j0 ohms and the
antenna is being fed with Z0=100 ohm feedline. There are no
reflections on the feedline which means a Z0-match to 100 ohms exists
at the antenna feedpoint. Assume the characteristic impedance of the
antenna wire over ground is 600 ohms. The 600 ohm to 100 ohm impedance
discontinuity at the feedpoint creates a reflection coefficient of

0.7. That's where the reflections on the standing wave loop antenna
are coming from. One reason the feedpoint of a resonant loop is higher
than for a 1/2WL dipole is that the reflection coefficient for the
loop is 0.7 while the reflection coefficient for a dipole is obviously
1.0 at the ends of the dipole.

>The concept may be easier to understand using a rhombic example. A
terminated rhombic is terminated in the characteristic impedance of
the antenna wire above ground, e.g. 600 ohms, which eliminates
reflections on the antenna and turns it into a traveling wave antenna
where the feedpoint impedance of the antenna is equal to the
characteristic impedance of the antenna over a wide frequency range,
i.e. Zfp = Vfor/Ifor, independent of frequency.

>Removing the termination turns the rhombic antenna into a standing
wave antenna and the feedpoint impedance becomes Zfp = (Vfor + Vref)/
(Ifor + Iref), i.e. the feedpoint impedance is frequency dependent
like other standing wave antennas.

What you are missing is that the loop is an antenna, not a
transmission line. On a transmission line, the currents are
differential, i.e. 180 degrees out of phase and a short-circuit is
possible. At the antenna feedpoint the left differential current takes
a 90 degree turn to the left. The right differential current takes a
90 degree turn to the right. *That puts the antenna currents in
phase*, i.e. in common-mode, so a short circuit on an antenna 40 feet
in the air is not possible. The fields that are 180 degrees out of
phase no longer cancel because of the physical distance between them.

From the feedpoint of the antenna, there is no such thing as waves
launched in opposite directions on the wire *at the same time*. What
you are missing is there is no short-circuit half way around a loop
because there is no impedance discontinuity at that point. Forward
waves continue traveling forward and reflected waves continue to
travel backwards at that point because there is no impedance
discontinuity at that point. It takes an impedance discontinuity to
cause a reflection. Assuming a circular horizontal loop (for the sake
of conceptual simplicity) the only impedance discontinuity is at the
feedpoint.

Hello Richard,

Your formulas can be disputed:

When using (from http://www.ece.msstate.edu/~donohoe/ece4990notes5.pdf):

Rr_loop = 320*(pi)^4*A^2/lambda^4

for f = 3.6 MHz, Dloop = 1.27m (so A = 1.27 m^2),

Rr_loop = 0.001 mOhm.

This result agrees the number in my previous calculation (for the same
situation).

From the same source, but for a dipole of 1.27m with large end-
plates,

Rr_dipole = 80*(pi)^2*le^2/lambda^2 = 0.18
Rr_dipole = 0.045 Ohm (without large end-plates).

This is roughly a factor 45 or 180 more (for the dipole).

Maybe somebody can confirm the above calculations.

The actual efficiency depends on the required (space consuming) reactive component to cancel the capacitive (dipole) or inductive (loop) behavior.

The advantage of the loop (especially for reception) is that you need a variable capacitor instead of a variable loop, and matching / balun function can be made easily. He also mentioned the vertical radiation component (NVIS operation) together with the nulls in the horizontal plane.

Regarding claims, Norbert didn't make claims about the high efficiency. Please read his conclusion that starts with "despite the low efficiency of 3%….". His stated 3% reasonably agrees with my 3% (though you think that the calculation may be wrong). The claim with regards to performance comparable to a half wave or vertical antenna is for higher frequencies (where the loop's efficiency increases significantly).

Of course I have serious doubts about the conclusions regarding general noise cancelling properties, but the conclusions can be right for that special RF-environment. Whether they apply for another situation, can be food for the radio amateur experimenter (or professional?).

With kind regards,

Wim

Hello Richard,

you used r = 1m (as you have r in your formulas), that is D = 2m,
6.28m circumference.

I used D = 1.27m (4m perimeter), that is r = 0.635 m.

Quote from Norbert's site:
"When a magnetic loop antenna is used for 3.5 MHz with a perimeter of
4 meter (13.3 foot) , it has an efficiency of approximately 3%."

Maybe this helps you to explain the difference between your and my
result,

Wim

Revision: 1.1 2009/04/12 19:42:04
Posting-Frequency: posted monthly
URL: http://www.panix.com/~rram/usenet/rram/index.html

Changes followed by "|".

After a 30-day public discussion and feedback period to gauge reader
opinions in March of 2009:

http://groups.google.com/group/rec.radio.amateur.moderated/browse_thread/thread/d7d337db35
f23326

the rec.radio.amateur.moderated Moderation Team has decided to consider
amending its charter, and permit limited simultaneous crossposting to
rec.radio.amateur.moderated and one other unmoderated
amateur-radio-related discussion newsgroup. We are currently trying
this on a temporary basis (90 days, through early July 2009), and adopt
it permanently if successful.

Approved rec.radio.amateur.* newsgroups are those that are currently
listed in the latest version of the "List of Big Eight Newsgroups" which
is crossposted monthly to news.announce.newgroups, news.groups, and
news.lists.misc.

Approved alt.radio.amateur.* and alt.ham-radio.* newsgroups are those
that have been created consistent with the suggestions in "So You Want
to Create an Alt Newsgroup" at:

http://www.faqs.org/faqs/alt-creation-guide/

Approved regional hierarchy newsgroups are those that contain either
"radio.amateur" or "ham-radio" in their names, including
uk.radio.amateur and aus.radio.amateur.misc.

We will make every reasonable effort to keep our list of approved
newsgroups up-to-date. In case we have overlooked any, and a submission
is rejected in error as a result, the rejected submitter can E-mail us
at our administrative contact address (in the signature at the bottom of
this article, and the default Reply-To for the rejection message)
requesting that it be added, and that the article be approved. We may
still choose to reject articles crossposted to any alt.* newsgroup with
an inappropriate name, including obscene language, embedded
name-calling, or encouragement of unlawful conduct.
```

Please direct any comments, questions, or criticisms to
rec-radio-amateur-moderated-request@panix.com.

>6.28m circumference.

It is the specified diameter/radius of the 80M antenna at the link of
the antenna manufacturer. I stated that quite clearly. I choose to
go to the source rather than rely on possible transcription errors in
amateur postings.

>I used D = 1.27m (4m perimeter), that is r = 0.635 m.

That antenna does not exist.

>Quote from Norbert's site:
>"When a magnetic loop antenna is used for 3.5 MHz with a perimeter of
>4 meter (13.3 foot) , it has an efficiency of approximately 3%."

There is no Ciro Mazzoni antenna with that dimension.

I specifically asked if this statement was for the MIDI loop antenna
with a 2 meter diameter (and is designed for 80M operation). To this
point no one has affirmed or denied this my natural selection from the
manufacturer. The page quite clearly reveals three photos of the
distinctive design. The Mazzoni antennas also come in distinctive 1m,
2m, 4m integral sizes. There is no 1.27m diameter tuned loop
offering.

>Maybe this helps you to explain the difference between your and my
>result,

The original page (2) contains errors or misattribution (same thing),
that is why I am careful to trim away the textual noise and restate
what I perceive to be the model under investigation.

Hi OM,

Well, as you can imagine (barring the numerous errors and moral judgments), it all depends upon the band you want to operate - with the 40M and higher frequencies quite well served.

A lot of myth surrounds what are called "magnetic loops" and this thread has corralled some of them - including from Norbert as his page which forces the argument that fairly agrees that below 40M performance dives. However, through sloppy bookkeeping, the Ciro Mazzoni line is not one I would walk away from for stated "inefficiencies."

The principle consideration is the ratio between radiation resistance (power that is expressed into making contacts) and Ohmic loss (bulk metal conductivity power that is expressed into making heat). Wimpie's choice of 20mm diameter stock (how that arrived in the mix is a mystery) compares poorly with the Ciro Mazzoni 50mm tubing for its smallest design.

The 80M design from the vendor uses 75mm stock for good reason and this should be a selection guide for your application. Their second 80M design uses 140mm stock! Pushing this further with conductance now nailed down, you want a large loop because the radiation resistance varies by the fourth power of dimension. That is to say, if you double the loop radius, you obtain 16 times the radiation resistance. Small changes in loop radius can quickly escalate or emasculate efficiency. Radiation resistance is the beneficial characteristic of how we manage to couple a signal out into space and which is typically thought of as being 50 Ohms (although this is rarely the actual value that more often varies between 35 and 70 Ohms for simple wire antennas of conventional length).

As you can see from these resistance figures, the difference between a radiation resistance in the thousandths of an Ohm, and typical values in the tens of Ohms is a hallmark for caution. When paired with metal resistance in the Ohms (something that ordinarily only comes with using wire-wrap wire for long runs), you want to boost radiation resistance as high as possible. When paired with metal resistance

that is in the thousandths of Ohms, there is every chance you are looking at 50% efficiency for 1 meter diameter loops.

Bigger radius comes with its own problem, however. It limits the high band of operation as these designs are optimized for being a small portion of wavelength. Observe the various design options from Ciro Mazzoni, and you will observe they are specified over only two octaves for any particular design. That should give you a clue if you want to homebrew your own, because you will encounter the same limitations of coverage regardless of construction method.

So, this returns us to the first statement above: it all depends on which band(s) you want to work. It further depends upon your pain threshold for poor efficiency if you choose to push beyond the coverage limits. Professionals describe this in terms of a cost/benefit ratio. If we restrict discussion to non-professional qualitative expressions of benefit: super, great, fantastic, maximum and peg escalating dollar amounts to each with corresponding breathless emphasis - then there are many deals for sale on those terms for the gullible.

Hello Chris,

Which antenna will fit your needs depends on many factors (tuning range, indoor/outdoor, aesthetics, local regulations, your experience/ preference, available volume, house construction, buy or homebrew, available materials, local or DX use, etc). So I can't judge whether a loop is good solution in your situation.

In addition, "the" best antenna for the transmitting case will very likely not be the best one for the reception case.

Best regards,

Wim

Hello John,

When you cut the loop at two opposite positions, yes, you can make
your "electric" loop.

It will generate lots of E-field, you may need another coil for
matching, and it is probably less efficient then a short straight
dipole with massive capacitive disks to get larger I*delta(le)
product.

Best regards,

Wim

Hello, and the not-so-subtle point is that there aren't magnetic, electric, or any other such "types" of loop antennas. There are just loop antennas that can further be described as shielded/unshielded, balanced/unbalanced, electrically small or large. Just like we don't transmit (propagate) electric (E) or magnetic (H) fields by themselves.

The purpose of an antenna is to radiate and/or intercept an electromagnetic field. By definition energy radiated by a transmitting antenna is not temporarily stored in the antenna's local electric or magnetic field. It's been released into free space subject to interception by a receiving antenna(s) or any other parasitic structures. The receiving antenna transfers part the intercepted energy to the load (receiver and other dissipative losses) and scatters the rest back into free space.

By contrast, a transformer, for example, is a "magnetic" device that is intended to transfer energy by a localized means (induction) other than the propagation/interception of electromagnetic radiation.

To further confuse the issue, a conductor in the near (reactive) field of a transmitting antenna will have current induced in it by the antenna's local electric and/or magnetic fields. However, that's not the usual purpose for which we design antennas. An exception might be the immoboliser (PATS) system used in late-model motor vehicles that incorporates a ring antenna embedded in the steering column that is closely coupled at RF frequencies to the transponder chip and loop antenna embedded in the vehicle ignition key. So is it a transmit-receive antenna configuration or a primary coil-secondary coil transformer configuration? Given the proximity of the inserted key to the steering column I would guess the latter. Sincerely,

Hello, all. I should also add that in stating the above I was only considering nearby conductors (towers, metal on buildings, etc) and wasn't including the local directors/reflectors that may be incorporated into an antenna to provide the desired radiation pattern characteristics. Sincerely,

If in your opinion there do not exist antennas that generate a
dominant magnetic or electric field (in the near field), then you are
contradicting yourself, as you can't transfer energy with a magnetic
field or electric field only. So your transformer also involves
electric fields. Maybe you should look into the Poynting theorem.

When a noise source is about 5..10m away from an 3.6 MHz antenna, the
coupling of that noise source towards a "magnetic" loop antenna may be
different from the coupling towards an "electric" antenna, though
both antennas may produce the same far field radiation. This is not
from a textbook, but from experience (I am also working in power
electronics).

I fully agree with you on the far field statements, but when you live
in an apartment (where significant spurious emission from home
equipment are in the near field of your 3.6 MHz antenna), a so-called
magnetic loop antenna may behave different (w.r.t. a short "electric"
dipole). It can be worse or better. Many radio amateurs know this from

experiments, without knowing the EM theory behind it.

I have no problems when people talk about a "magnetic loop antenna". It shows me that they are discussing an antenna with a circumference < 0.2 lambda. When people talk about a "loop antenna", it can be anything.

Best regards,

Wim
PA3DJS

Text books would enlarge that volume to one half to several
wavelengths for the "near field." The text books would further
clarify this with math (yes, I know, professional and academic
discussion in light of this being an amateur forum is anathema) and
define the difference with the terms Fresnel diffraction (near-field)
and Fraunhofer diffraction (far-field). The operative physical length
of the antenna becomes meaningful, but this is getting ahead of what I
call the "benchmark" method below.

To give the magnetic loop aficionados the benefit of this, all local
noise within 100 feet would be susceptible to interfering and it
wouldn't be nullable (which is a characteristic only observed in the
far-field) except by polarization which is very haphazard in the
near-field. I have never seen a magnetic loop mount with the
necessary degrees of freedom to employ this method of "nulling." As
such, the vaunted characteristic is elusive and thus becomes legendary
rather than fulfilled.

However, the term "near-field" is rather vague. The more appropriate
discussion is found in "reactive near field" and "radiative near
field." The discussion of loop coupling to magnetic (while ignoring
electric) fields would suggest "reactive near field." In this regard,
the 80M volume of reactive interference is still roughly 100 feet in
all directions. The "radiative near field" would encompass a volume
out to 80 meters (roughly 250 feet). In either case, apartment living
finds no panacea in loop antennas.

There is another, non-textual (at least to the casual reader),
benchmark that such issues are measured by the physical spread of the
antenna itself (this usually attends discussion of capture area to
many's frustration). Here, I am returning to the allusion above of
Fresnel diffraction (near-field) and Fraunhofer diffraction
(far-field). The math (non-techs, turn your eyes away) is as simple
as:

2ï¿½Dï¿½/lambda

Let's work some examples from the sublime to the ridiculous on 80M.

The traditional half-wave dipole antenna that exhibits the traditional
usage for distinguishing between near and far:
2ï¿½40ï¿½/80 = 40 meters
a smaller quarter-wave dipole antenna
2ï¿½20ï¿½/80 = 10 meters
a tenth wave dipole antenna
2ï¿½8ï¿½/80 = 1.6 meters
a fortieth wave dipole antenna
2ï¿½2ï¿½/80 = 10 centimeters

Let's see where discussion follows in this regard.

where is your square?

Fraunhofer region starts at (22.5 degrees phase shift):

r = 2*D^2/lambda

D = largest antenna size (excluding structures that doesn't carry
current).

Formula is only valid for electrically large structures, so not an
electrically small loop or dipole.

For electrically small loops, reactive fields are dominant for:

r < 0.16*lambda

Smaller loop size does not result in smaller reactive field zone. The
correct formulas you can find everywhere. To make it easy for you:
http://www.conformity.com/past/0102reflections.html shows the
complete formulas for the electric and magnetic case, and a graph at
the end.

Hi OM,

The specifications of the major vendors that I have seen are usually
reliable.

You still need to answer what bands do you want to transmit on? If it
is 40M and up, you are pretty sure to find a lot of useful designs.

given that I have already demonstrated that, and more, what importance
do you attach to this that hasn't already been shown?

>Smaller loop size does not result in smaller reactive field zone.

What a curious defense for magnetic antennas's noise immunity.

However, the magnetic antenna is not immune from the reactive fields
of noise emitters that are very much larger than any loop discussed
here. It is the field of the emitter that is important. I thought I
would wait and see if anyone cottoned on to that aspect of the
discussion. If we proceed with the assumption (repeated here):
>Smaller loop size does not result in smaller reactive field zone.
then the magnetic antenna is doomed to noise in the same sense as an
electric antenna is. Offhand I would speculate that in an apartment
situation, a magnetic antenna on the balcony is saturated with
reactive noise fields.

Hello Richard,

> What a curious defense for magnetic antennas's noise immunity.

Where did I mention that this relates to noise immunity? I only tried
to point you to a misconception regarding the use of the 2*D^2/lambda
formula.

[start quote]
> The traditional half-wave dipole antenna that exhibits the traditional
> usage for distinguishing between near and far:
> 2 40 /80 = 40 meters
> a smaller quarter-wave dipole antenna
> 2 20 /80 = 10 meters

> a fortieth wave dipole antenna
> 2 2 /80 = 10 centimeters
>
> Let's see where discussion follows in this regard.
[end quote]

You want to believe us that a usable antenna with size=2m and
lambda=80m satisfies far field conditions at 10 cm, I really hope I
understood you wrong.

> However, the magnetic antenna is not immune from the reactive fields
> of noise emitters that are very much larger than any loop discussed
> here. It is the field of the emitter that is important. I thought I
> would wait and see if anyone cottoned on to that aspect of the
> discussion. If we proceed with the assumption (repeated here):
>

The dominant reactive field from a small "magnetic" loop or "electric"
antenna at lambda=80m extends to somewhat more then 10cm, think of
about 5m. Though the far fields may be similar, the reactive fields
are completely different in orientation, strength and E/H ratio. See
for example the link posted earlier:
http://www.conformity.com/past/0102reflections.html

This will result in complete different coupling to conductors present
in the reactive field zone. When using reciprocity, this will also
affect the coupling from noise current in the conductors towards the
antenna. So I can't follow your statement below:

>wimpie: Smaller loop size does not result in smaller reactive field zone.
> then the magnetic antenna is doomed to noise in the same sense as an
> electric antenna is.

Of course I agree with you for the case the noise source extends over large distance.

What antenna is better, you cannot say beforehand and is food for the experimenter (as I mentioned earlier).

This topic becomes lengthy. Do you think that it will result in better statements from other people on there websites (that was the subject of my first contribution)? The second part was just to show that the 3% claim for a 4 m loop (circumference) at 80m isn't bad.

I have real doubts about it, so I decided to send PM to Norbert some days ago to setup a more constructive discussion.

With kind regards,

Wim

Reciprocity does not appear in the text at your link and the concept
you are offering appears to be an invention that is unsupported. Let's
stick with unraveling one thing at a time.

So, working with your link's assertions give me a simple quantified
indicator of a reactive field.

Hello Richard,

As I assume you understand complex calculus, that link (
http://www.conformity.com/past/0102reflections.html) was just to help
you to figure out field orientation and strength versus distance for
the magnetic and electrical case.

If you still believe in the 2*D^2/lambda far field formula for
electrically small antennas, I doubt whether it is useful to continue.

Best regards,

Wim

Hello, and that is correct. The Maxwell equations apply in all these cases. When solving such problems, especially when dealing with antennas, the total E-M field contains both reactive (electric/capacitive & magnetic/inductive) and radiative components, although certain components predominate depending on distance from the excited structure.

When dealing with A.C. circuit problems where dimensions are a fraction of a wavelength, one can usually ignore the the radiative/propagation components. Why solve a problem with a sledgehammer when a small claw hammer is adequate? Wouldn't you rather use Ohm's law in such case rather than dealing with E and H fields? For example, the behavior of A.C. power power distribution lines operating a 60 Hz can certainly be modeled using transmission line equations but unless they're very long (implying a propagation delay), a lumped-element/circuit approach is much more easily dealt with (lumped lines. And yes, I'm intimately familiar with the Poynting theorem and its derivation. (The designers of the CFA obviously weren't).

There's no such thing as "magnetic" and "electric" antennas. The marketing departments of antenna vendors or others can call these whatever they want but they can't change the laws of physics. Now, if one dimensions a loop antenna or dipole antenna small enough (compared to a wavelength, one obtains a magnetic or electric dipole, respectively. Such dipoles (note the absence of the word "antenna") are a theoretical concept but can be applied in practice to those structures having electrically small radiators/interceptors.

Hey, I'm a fellow Ham and well aware of the contributions over the years by hams to antenna design. Many times, however, established electromagnetic theory is distorted to match the perceived observation. In the case of noise immunity I would discuss the size of the victim antenna, the antenna type (e.g. loop or dipole), antenna dimensions, orientation and proximity wrt the offending noise source, and whether the victim antenna is shielded and balanced. Unless one is referring to an electrically small antenna treated as a magnetic or electric dipole, typing an antenna as "magnetic" or "electric" is meaningless.

Whoops, we have to be careful to not getting involved in a new
discussion, but I agree on your statement regarding that "special"
antenna and the statements regarding whether or not to use distributed
versus lumped circuit approach.

That is why I added the word "dominant", as you can't transfer energy
with H or E only and we were discussing small antennas as shown on
Norberts website.

One may imagine the electrically small magnetic loop antenna as the
primary of a transformer where there is no secondary coil in the
reactive field. The RF leakage (far field radiation) by accident hit
the antenna of another amateur.

I agree on the above. Let I mention the two letters "EH" in addition
to your three-letter combination to avoid a new discussion...

So from twice to infinity. Still not a quantity. You seem to have the
same problem for which you berate others.

OK, so you cannot present a simple quantified indicator of a reactive
field from your own source.

It is quite apparent without going into math (I thought that appeals
to professionalism and academics like complex calculus were verboten
here) and I see it quite plainly ILLUSTRATED in Figure 3.

However, if you cannot vouchsafe for this source and agree to what it
represents, you are right, there is no basis for discussion.

2 (twice) is not a number? The antenna most frequently discussed is a
40th wave or 2 meters across. These are two more numbers (40th and
2). Twice that yields to more numbers (20th and 4).

Infinity is not a number.

You didn't say twice. You said "twice - at least". So what number is
that, Dick? I was taught that the phrase represented a range, not a
number. All you did was put a lower bound on a number you don't know.

>> here.

Choose a "loop discussed here," and you have a number (1, 1.6, 2, and
4). Double (at least) that number, for that loop, and you have a new
number for the noise emitter (2, 3.2, 4, and 8). If you want to more
than double the original number (1, 1.6, 2, and 4), there are probably
practical examples of noise emitters for those numbers too.

The lower bound works as a practical matter but is not exclusive of
other practical, larger emitters. One common example would be the
standard 80M dipole which would give you a number of 40, but that is
not the upper bound.

So, having said double (2, 3.2, 4, and 8) at least (which allows up to
40 which is more than twice any previous number) and there being
larger numbers that satisfy the observation, the larger numbers become
an issue of practicality, not number. There are Rhombics (certainly
impractical for many) that have dimensions of 320 meters:
http://www.pa6z.nl/PROJECTS/ANTENNAS/RHOMBIC/body_rhombic.html

I suppose now the point to argue is "Is 40 (or 320) very much larger
than 1?"

For the benefit of Wimpie and beliefs: "I would believe so, although I
am open to convincing argument that 40 (or 320) is NOT very much
larger than 1."

I have a tree here in the Tampa Florida area just begging to have a Hustler 4 or 5 BTV stuck in it. I have had great luck with ground mounted Hustler Verticals when I lived near the sal****er of Tampa Bay. I am now in Brandon Florida, east of Tampa, and far from salt water. I have stuck Hustler Verticals in trees before with radials for most bands, but had access to a bucket truck back then, and did not have stents in my heart. I got to thinking WHY not take a hustler vertical with only ONE Tuned "radial" for each band in the form of the lower part of a 1/2 wave dipole. In other words, make the Hustler Vertical into a multi band center fed 1/2 wave dipole. It will be a lot easier to deal with only one radial for each band if they hang straight down the tree vertically. Has anyone ever done this before ?

Source record: 5632

It would work, but the lower radials would have to
be spread apart to avoid coupling issues.
One could also just hang a second trap vertical as
the lower half of the antenna..
But, being I am a radio bully, I tend to avoid trap
antennas. Hustler verticals are pretty lossy on the
lower bands when you factor in the loss of the traps,
and then the upper level loading coil required to
resonate the thing.
If I were to use a commercial antenna to do what
you propose, I think I would prefer a Butternut over
the Hustler. :/
But anyway, what you want to do will work, but it
would be best to angle the radials a bit away from
each other to minimize coupling and the tuning
difficulties you would see if they are very close
to each other.
Also, the amount of ground loss will depend on the
antennas height in wavelength. So I wouldn't expect
gangbuster performance on the low bands unless the
antenna is very high. And how high must be determined
for each band measured in wavelength. High on 10m,
might almost be considered on the ground on say 80m.
So the amount of radials needed for an equal amount
of ground loss will very greatly to the frequency.
So if say the whip base is at 20 feet in the tree, and
you are hanging an 8ft radial for 10m, the performance
should be fairly decent. The antenna is up at nearly 3/4
wavelength, and one radial will do well.
But on 80m, 20 ft is just barely off the ground at
less than 1/10 WL high and the tree is not even tall
enough to hang it vertical. It would need to be run out
at an angle, and with only one radial at that low height
in WL, performance is going to be lame.
Of course, if you can mount it higher, the frequency
where lameness creeps in will slowly drop as you get higher.
:/
If I wanted to work all bands, I'd use the tree as a
support for an all band horizontal dipole.
Or even better, parallel fed full size dipoles, which
is what I usually run.
It would do a better job in the overall scheme of
things. You would have a semi decent NVIS pattern on
the low bands, and still be able to work some DX.

With stunted vertical on the low bands, NVIS performance
will be pretty lame. Many of the guys just running
plain Jane low coax fed dipoles will be kicking sand in
your face on the shorter lower band paths. :|

You are trusting that each radial will be resonant on only one band akin to a fan vertical antenna. What may happen, for instance, is that the 40m radial may accept an appreciable amount of energy on 15m and direct the 15m signal up at a high take-off-angle - less than optimal for 15m operation. Other interactions are possible, e.g. 28MHz/4MHz=7, 18.14MHz/3.6MHz=5, etc. Any vertical radial resonant at 3/4WL, 5/4WL, 7/4WL, etc. will have a suboptimal effect on the take-off-angle.

<ka7niq.7b97619@radiobanter.com> wrote:

>A wire trapped dipole would be easier to hang vertically in a tree.

Hi OM,

There are at least two difficulties with this - even though it sounds
eminently simple.

One, the two arms of the dipole have an uneven balance with ground.
This means that given the typical configuration of trap design and
placement, that the traps on each side must be different to account
for the lack of symmetry. In an ordinary horizontal placement, this
is not a problem.

Two, the standard advice for the feedline in a horizontal dipole is
that it drop away at a right angle for at least a quarterwave before
being turned in its route toward the shack. Well, the feedline still
has to drop away from the feedpoint, but with the antenna vertical,
this means it has to first move horizontally a quarterwave before
dropping and THEN turning towards the shack. This is unlikely to be a
practical construction, or you would have simply put up the dipole
horizontal in the first place.

The feedline trailing down alongside the lower arm of the vertical
dipole is going to seriously interfere with tuning and launch angle.
In a sense, it will be shorting out any traps in that arm.

This is why I offered the GAP line of products as an example of a
vertical dipoles. They are not the only line that offer a solution to
the problem of the feedline proximity. What they do is route the
feedline up INSIDE the lower dipole arm. Physics insures that the
inside of the arm is shielded from the outside. However, there is
still the problem of coupling at the lower tip (where the line enters
to go up). GAP puts a W2DU style choke there.

Now, as to your point of "hang vertically in a tree" suggests that the
GAP style antenna would be hung from its upper tip, rather than
mounted (electrically isolated too) at its lower tip. I'm sure you
could come to terms with that.

" Using such a pulse pattern makes the echo, which arrives back from the moon 2.4 seconds later". From: http://www.rense.com/general79/haarp.htm

"During the experiment, which was carried out on Oct. 28 and 29, 2007, the radar signals from HAARP were at 7.4075 MHz and 9.4075 MHz"

I do not know the distance to Moon on that days but for the mean distance 384 000 km the speed is:

384 000/2.4 = 320 000 km/s.

Speed of light is 300 000.

But long waves travel quicker in glass. Would be the same in space?

No. Maybe I don't understand the complex calculation under your quoted
division by 2.4, but....

Your "mean distance" have to be doubled: received *back* in 2,4 sec mean
that the signal traveled the double distance.
At minimum distance the moon is 356375 km far from earth. 356375*2 is 712750
km, that at light speed means a travel time of 2,37 sec.

Any greatest distance agree with classical physics laws, and a normal mind
don't care if the light travel faster, maybe care about the distance of the
moon at the time of test: exactly 360000 km from the earth.

Don't you ?

i'm glad you checked their calculation and found that obvious error...
i guess all the other radar calibrations in the world have to be
changed to account for the bialek speed effect... i wonder if that
would get you out of a radar gun speeding ticket?

The test was made at "full Moon". ""Even though lunar echoes have been
detected before at higher frequencies, it was really exciting to see them
arrive in real time out under the full moon in the New Mexico desert,"

I do not know the distance. But some radio amateur practice communication
via Moon. Have they own observations?

>
> Any greatest distance agree with classical physics laws, and a normal mind

Now are transmitters on the Mars. They are able to give the answer for
Maxwell. He wrote:
" " Incidentally, Maxwell once suggested that Roemer's
method could be used to test for the isotropy of light speed, i.e., to test
whether the speed of light is the same in all directions. Roemer's method
can be regarded as a means of measuring the speed of light in the direction
from Jupiter to the Earth. Jupiter has an orbital period of about 12 years,
so if we use Roemer's method to evaluate the speed of light several times
over a 12 year period, we will be evaluating the speed in all possible
directions (in the plane of the ecliptic). " From:

http://www.mathpages.com/home/kmath203/kmath203.htm

As you see Maxwell care if the light travel everywhere with the same speed.

The same is with the wave lenght. Longer water waves travel faster. Is it
the same with radio waves?

I have, at another amateur's station, on 432 MHz. Surprisingly the
speed came out almost dead on 300m/microsecond. Used .wav file
recording of transmit and echo and a good sound file editor with
sub-millisecond resolution when zoomed.

Surprisingly?

You were thinking that propagation might be at some other rate?

the dominant error source in your measurement is probably the sound
card's clock.

For other fun measurements of em propagation speed.. melting the mode
pattern of a microwave oven cooking chamber at 2450 MHz into a single
layer of marshmallows on a plate (turning off the rotating turntable and
mode-stirrer, of course). Chocolate morsels might also work.

Other methods, for visible light, include the spinning toothed wheels of
Fizeau and rotating multifacet prisms of Foucault (later updated by
Michelson)

Interference fringes from a laser, as well.

if one is looking for more "radio" than "light".. look at the doppler
effect from a moving source. The fractional change in frequency is
equal to the velocity/propagation velocity.

If you do something like measure the frequency from, oh, an orbiting
satellite and get the whole "doppler curve" you can figure out the
frequency of the oscillator (it's the frequency at which the second
derivative of measured frequency goes through zero). You can measure
the velocity of the satellite optically (if you pick a satellite which
is visible, like ISS)

There is no space. It is packed with compressed aether.

John

With implied facetiousness. Should have been more obvious I guess.

10m dish with full legal power, BTW. Very good signal to noise.

I have checked the Moon history and now I know that on Oct. 28 2007 was
"full Moon" at perygeum. So the speed was close to 300m/microsecond.

But I am steel loking for the evidences that the speed of radio waves is
temperature and wave lenght dependant.

<no

No for your (Heavisde's) paper waves.
My waves are Tesla's waves: http://www.tfcbooks.com/tesla/1929-09-22.htm

Tesla say in 1929: " The effects, according to my view, were due to minute particles of matter carrying enormous electrical charges, which, for want of a better name, I designated as matter not further decomposable. Subsequently those particles were called electrons."

The same wrote Faraday in 1846: http://www.padrak.com/ine/FARADAY1.html

I assume that the two greatest man are right.

Electrons are produced by the Sun (rare plasma +dust). They rotate with the Sun and their temperature is place dependent. Speed of the pressure waves must be also the place and frequency dependent.

But you do not care about that . You are fine with the EM waves. Are you?

No aether as "a medium filling all space, called the ether, which was
structureless, of inconceivable tenuity and yet solid and possessed of
rigidity incomparably greater than that of the hardest steel" (Tesla).

Space is filled with the ISM (rare plasma +dust). ISM is produced by stars
and rotate with them. So radio waves are the electron waves. Acoustic waves
are ions waves.

My experience with the Hustler 4BTV hasn't been good. Over two hamfest
I bought 4 of them, lucky for me I was only buying then for the tubing
and mount and paid around $10 each for them. I dont think any of them
had a trap that wasnt bad.

Jimmie

CB antenna for use on 17 through 10 meters, keep the feed line short,
and use it with a tuner. I have been reading that several Hams are doing
exactly this with the Antron 99 and Sirio Gain Master CB antennas, with
decent results. I do plan on a self supporting tower one day, but this
will get me on the air, until then.

in vacuum, of course, there is no dependency on wavelength.

in a dispersive medium, there is a dependency on wavelength. A good practical example of a dispersive medium for radio is the ionosphere.

interplanetary space also is very slightly dispersive (due to the small, but non-zero, ion content)

Inasmuch as temperature and ionization are related, I suppose there's a relation, but nothing like you see with sound, where there's a very strong relationship between propagation velocity and temperature (but that's because the mechanism of sound propagation is molecules/atoms colliding with each other)

Hello Chris,

From another thread I concluded you have a flat membrane roof.

If you plan to use the 80/75m antenna for NVIS (local traffic) mostly,
why not putting a horizontal dipole above your roof. It will be very
likely below resonance length, but you can match this to 50 Ohms. This
will almost certainly result in better efficiency w.r.t. the
commercial vertical. For 40m and below, you can go vertical.

If you like to experiment and know the problems w.r.t. RF high
voltage, you may try a vertical resonating antenna that is in half
wave resonance. You will get end-fed voltages in the kV range, but the
common mode current will be significantly less w.r.t. a quarter wave
resonating structure. This reduces the requirements for your ground
provision and the ground loss.

What is the height of the tree that you plan to use as support (in
other words what is the maximum vertical height you can use)?

With kind regards,

Wim

Hi Folks,

I've been blogging about our new life here in Costa Rica for the past couple of years at ' http://adullroar.blogspot.com' (http://adullroar.blogspot.com) and just started up another one that is solely about my ham radio hobby. Quite a few changes to the setup that I had in Oregon, though I was able to bring down my 2 elt. 5-band quad, though I had to leave behind the boatanchor gear. :p

I'm into CW and PSK31, have a couple of K2s, a KX1, and a Ten Tec Scout that is somewhere in a box still. My QSL manager is W6WU.

Anyway, stop by at http://cloud-warmer.blogspot.com where I will probably being writing a lot about my favorite part of the hobby, wire antennas!

I just finished modeling a 2 elt. rotatable EDZ for 10 meters that shows over 13 dBi and over 12 dB F/B! I hope to have it in operation in a month or two. You can download the .nec file at the blog.

73 es pura vida,

Casey, TI2/NA7U

If you put an autotuner at the base of a 1/4 wave 10m vertical (i.e.
2.5m long), and some random length radials, for 10,12,15,17, and 20, it
will work fairly well.

The feedpoint impedance of a half length antenna (i.e. 1/8 wavelength vertical) isn't so horribly different that losses will bite you. (for comparison.. I ran some models a while ago for a 20-odd foot vertical. resonant (Z=39 ohms) at 9.4 MHz, and at 4.7 MHz, the z was 14-271j. I just happened to have that data handy.. you're looking at a shorter antenna and higher frequencies, but the ratios are likely to be similar.

W9CF's tuner calculator says a T network for the first case (Z=39 at 9.4MHz) would have 0.1 dB loss (3%), and for the second case, you'd have 1.7dB loss (33%)

While it's not great to burn a third of your power in tuner/feedline losses, on the other hand, it's also not horrible.

If you can put up something that's around 3-4 meters (10-13 feet) long, that will work even better. A piece of plastic pipe with some 12gauge wire inside it, for instance. or a 10 foot length of thinwall 1/2" conduit (sure, it's steel, but it's also got pretty good surface area.. without actually doing the calculation, it's probably comparable to a 12AWG wire in resistance)

The Tree is about 40 feet tall, and yes I do have a flat roof. I could attach a sloping wire from the tree to the roof, and center feed it with ladder line. This wire would be about 60 to 80 feet long, give and take a little. Unfortunately, it will be very visible!

You won't see it except when it's not in vacuum and then it's very
difficult for people like you to detect it. You actually have to do
something.

There is a good Filter Design Tool at http://www.aade.com/ which you can use to design bandpass, lowpass, and highpass filters with any number of poles and configurations. It's free but it nags you until you buy their LC Meter.
The LC Meter is a good bargain and if you are going to build filters, you need to measure a lot of Ls and Cs.

If Tesla is right than the radio waves propagation is electrons colliding
with each other.
Faraday was the same opinion: "I suppose we may compare together the matter
of the aether and ordinary matter (as, for instance, the copper of the wire
through which the electricity is conducted), and consider them as alike in
their essential constitution; i.e. either as both composed of little nuclei,
considered in the abstract as matter, and of force or power associated with
these nuclei"

Faraday known that the speed of waves is the same in copper and space. The
media must be the same. Charged particles = electrons.

Analogy sound - electric waves is full.

RF waves (fields/photons) cannot exist or flow IN copper. RF waves (fields/photons) flow in the space surrounding copper. The free electrons in a copper wire move only at a tiny fraction of the speed of light, 0.00028 m/s in the Wikipedia example. For RF signals, the electrons move hardly at all and can be considered to be vibrating in place acting as a sort of bucket brigade for the photons.

Hello Chris,

My idea is/was to have the (short) 75/80m dipole above your roof (assuming that the roof supporting structure isn't conducting). When you put the matching components and balun function in a box on the roof, you can go down with just a coaxial cable. This will keep the VSWR within acceptable limits to allow further matching in the shack. If space/visibility permits, I would go for the ladder line as you suggested. Main disadvantage of the dipole above the roof: interference from and towards domestic equipment.

When the visibility of the dipole above the roof meets aesthetic rules by far, you may put 2 or more wires to the dipole (fan type short dipole). This reduces the reactive component, without reducing the radiation resistance, so matching becomes easier. Visibility, is this really a problem?

Given the size of the tree, 40m and below should be possible without huge investment in ground provision. For 10m the wire/tube length isn't good, unless you can add a reactance to get collinear behavior.

The above doesn’t mean 80m isn't possible, but due to the low radiation resistance (about 5 Ohms), you need a better counterpoise / ground provision, and the NVIS performance of your vertical isn't good.

As with many things, making a choice isn't easy. A tree 60..80 feet from your house looks very attractive from an interference perspective.

With kind regards,

Wim

My first post: "" Using such a pulse pattern makes the echo, which arrives
back from the
moon 2.4 seconds later". From: http://www.rense.com/general79/haarp.htm

"During the experiment, which was carried out on Oct. 28 and 29, 2007, the
radar signals from HAARP were at 7.4075 MHz and 9.4075 MHz"

I do not know the distance to Moon on that days but for the mean distance
384 000 km the speed is:

2x384 000/2.4 = 320 000 km/s."

At that time the Moon was at perygeum so the speed was 300 000.

Speed of light in air, glass, water is temperature (mirage) and
wavelenght.dependent.

In space should be the same, but for Tesla's waves.

Anyone that would call me fat needs new spectacles. :/
I have been known to sweat, but only profusely when I
have to work in hot attics.
I am socially maladjusted, and actually thrive in this
state. My dad was never a ham, so I can't blame him for
being radioactive, or even a radio bully for that matter.
His idea of a hobby was cooking portions of dead animals
on a charcoal grilling device. No RF required.

I recorded the audio from the 2008/01/19 test. Did you?

What measurements did you get from it?

I am very interested.

I have reportable results. It was a perigee plus or minus your
location. And I have a correction factor for the delay from the HAARP
site to my location in Minnesota.

Do you know your location?

What do you have for results?

The Moon being full has nothing to do with it's distance from Earth or
it's radio reflectivity.

You are a babbling idiot.

Quite incorrect, since perigee was 366435 km on the 19th. Your number
is way too low for what it would have been on the 22nd.

Do you ever check anything for correctness?

Longer waves travel faster in air and glass. The same is in real space. But
I do not know how much. So I am asking.

I am asking if radio waves are faster than light.
Now is possibility to measure the both between the Earth and Moon and speed
of radio waves between Mars and Earth..
For centuries is possibility to measure speed of light in space between
Jovian and Earth.

Probably the Moon is to close to the Earth to pick up the difference. Is it
enough at full correctness?

Others have mentioned AADE's program, which is good. I usually use Elsie (www.tonnesoftware.com); the free version will likely do what you need. Elsie and the AADE program are different enough that it's worth having both if you do much filter work. For simple filters, there's an ap in RFSim99, which is a worthwhile program for all the other things it covers too -- also available by free download. And of course there are plenty of web-based filter designers.

One thing to beware of is that the filter design programs won't in general tell you everything you should know about practical aspects. Some will let you put in coil Q, which is helpful, but they usually won't tell you the effects of stray coupling between inductors, or of stray capacitance. Some filters I've worked with are very tolerant of a little stray coupling, and others are extremely sensitive to it. If you build a filter according to a design that either the AADE progarm or Elsie gives you and it doesn't perform like you think it should, don't be too quick to blame the program!

If you tell us more about the goals for the filter, we might be able to give you some further hints.

Cheers,
Tom

It is an obiect of interesting for ages. The first was observing of color
changes of Io (Jovian's satellite). But the difference in light frequences
are small.
But light and radio waves have extremally different frequences. You wrote:
"Tests of earth to moon to earth, earth to venus to earth all give the
> same speed of light regardless of frequency used." Write "if radio waves
> are faster than light".

Speed of light in space is known thanks Roemer.s method. Now are radio
transmitters on the Mars and is possibility to use the Roemer's method for
radio waves. NASA know the results. Are thy pulished?

The speed of light and the speed of radio waves are identical, you babbling
idiot.

Light and radio waves are the same thing at different frequencies, you
droooing cretin.

If you had ever read anything written less than 100 years ago, you would
know all this was proved long ago, you gibbering moron.

In todays textbooks is wrote that speed of light is frequency dependent
(glass prism).
The same is in air (atmosphere). Why the heliosphere is different?
S*

You can't read, you babbling moron, that is NOT what today's textbooks
say.

The speed of light is not frequency dependent, it is medium dependent,
that is it is dependent on the refractive index of the medium.

The refractive index of a medium is frequency dependent.

You haven't a clue which is the cause and which is the effect.

The difference of which you speak is very small. The atmosphere is
about 0.27 % of the total distance between the earth and the moon.
0.27% of "very small" would be very, very small.

Not precisely true. Interplanetary space slightly dispersive. Emphasis
on *slightly*.

Kenelm Philip predicted a difference back in 1957

Modern estimates for electron density in interplanetary space of 1E6 to
1E10 per cubic meter.

dTau = e^2*Ne*L/(2*pi*m*c) * (1/f1^2 - 1/f2^2)

e= charge on an electron 1E-18 Coulomb
m = mass of an electron at rest (9.11E-31 kg)
c = velocity of light (3E8 m/s)
L = propagation distance
Ne = electron density (pick a number between 1E6 and 1E10)

f1 and f2 are the frequencies (in Hz) (assumed relatively closely spaced)

To bound the magnitudes.. for 1000 light year and 1 and 2 GHz, the
dispersion is about 1 nanosecond.

Of course, they're published. Widely. I would check Journal of
Geophysical Research or similar publications.

As a practical matter, precise measurements of the time of flight
to/from a spacecraft is used to figure out where the spacecraft is and
its radial velocity.

Typical range accuracy is on the order of a few meters, velocities good
to a few cm/s, for something at the orbit of Neptune or Uranus.

Precise doppler measurements are used for radio science experiments,
e.g. to determine the internal structure of a planet or moon by
precisely measuring the orbit of a satellite. A typical performance for
such a measurement is 1 part in 1E15 over 1000 seconds at 32 GHz or 8GHz.

Hmm, without getting into the ad hominem attacks here..

This kind of thing is well documented. I'd start by downloading the "Plasma Physics Handbook" from the Naval Research Lab. It has a nice summary of all the relevant equations and typical values.

A quick google for "interplanetary EM propagation dispersion" turns up plenty of references.

Again, though, it's very, very small (parts in 1E12 kind of small).. but big enough to be of interest to scientists who measure such things. It would be the ambitious amateur who could make a measurement of the required precision, but it is doable. Several spacecraft transmit simultaneous tones generated from a common high quality reference. Working out and removing the effects of the Earth's ionosphere and atmosphere are probably the biggest challenge.

Yeah, you know that and I know that, but the babbling moron that continues
to post his mindless gibberish refererenced to something written 150 years
ago doesn't know that.

Thanks for the link. Very nice, concise. Actually wasted some paper on it.

And I doubt sb has a hint of a clue concerning it. He'll probably think
it supports his twisted view of things.

I used to think he was a troll. I am now convinced that I was incorrect
and that the ad hominum attacks are probably deserved. Sometimes they
are the correct approach and produce results. See politics (both sides)
and national news (all) for examples.

Roemer's method is the one way measurement. See:
http://www.mathpages.com/home/kmath203/kmath203.htm

We know where Jovian is so the one way measurement is possible. With
spacecraft it is impossible.
Lately the one way is possible with the Mars. But independently for radio
waves and light. Mars has the satellite and radio transmitter.

In next your post is Table 1 and Fig 2. There are electrons density and
temperature. Speed of waves is temperature dependent.

Roemer's method is able to measure the speed of light in different region of
Solar system. Before me Maxwell was interested in this: "Incidentally,
Maxwell once suggested that Roemer's method could be used to test for the
isotropy of light speed, i.e., to test whether the speed of light is the
same in all directions. Roemer's method can be regarded as a means of
measuring the speed of light in the direction from Jupiter to the Earth.
Jupiter has an orbital period of about 12 years, so if we use Roemer's
method to evaluate the speed of light several times over a 12 year period,
we will be evaluating the speed in all possible directions (in the plane of
the ecliptic). "

It is interesting that Roemer has measured 220 000 km/s.
S*

Velocity is delta-length divided by delta-time. The length of a meter
depends upon the velocity and orientation of the meter stick. The
length of a second depends upon the velocity of the clock. Are we sure
that the velocity of light is a *universal* constant or is it just a
conceptual stake in the ground to try to keep everything in the
universe from being relative to something else?

From the same data Newton calculated 310 000 km/s. But it was for the Earth
the Sun (the hottest region).
Roemer's method measures speeds of light in different regions of the Solar
System.

Cecil wrote: "Are we sure that the velocity of light is a ".

"c" is the *universal* constant in EM (calculating factors between different
units).

"velocity of light" is the medium and temperature dependent.

not true. We do one way measurements from spacecraft all the time. A
high quality oscillator (aka USO)is used to generate a set of phase
coherent signals at different frequencies.

Look at PN ranging or Sequential Ranging.

> or Elsie gives you and it doesn't perform like you think it should,
> don't be too quick to blame the program!

My experience is basically...

-- The behavior as-built will almost always be at lower frequencies than what you designed for, due to the stray capacitances and inductances the simple filters don't take into consideration. Similarly, bandpass filters will usually end up narrower than you intended.
-- For bandpass filters, it seems just about as common that coupling between elements, approaching self-resonant frequencies, and parasitics can help just as often as they can hurt insofar as shape factor goes.
-- Taking a scrap piece of PCB material (or some other thin metal sheet-type material) and placing it midway between pairs of inductors can give you some qualitative idea as to how much coupling there is. (...and normally you want to place consecutive inductors at right angles to one another... or perhaps try the "magic" 54.7 degree angle like the old neutrodyne receivers used...)

If you need quite sophisticated filter designs, Nuhertz (aka, Jeff Kahler, Inc. -- a man who can probably quote large portions of Zverev's book...) has their Filter Solutions program, which is quite good... although only a very basic version of it is free (apparently Jeff wants to eat every now and again, and not just at Taco Bell).

560. Need Diamond X50a ground radial dimension

Newsgroup: rec.radio.amateur.antenna
Date: 2011-03-16 06:22:52 UTC
From: Jeff Liebermann <jeffl@cruzio.com>
Message-ID: <9dl0o6h0c7m5lp547ur6jfc0u2lfan3410@4ax.com>
Source record: 5461

Another day in antenna hell. This time, I needed a 440Mhz antenna for
a temporary repeater installation. My last remaining antenna a rather
broken Diamond X50a. The previous owner leaned the antenna against a
wall, and then backed his car into it, breaking the fiberglass radome
and bending the guts. I managed to unmangle the antenna and epoxy the
radome, but somewhere in the shuffle, the ground radials disappeared.
Duz anyone have an X50a handy that can measure the length of the
ground radials (from the aluminum base casting to the end)? The
current random length welding rods (with toothpicks jammed into the
holes) are not going to last.

I don't know why Mars would be the best..

But you might start with googling "ranging Mars radiometric" or
something like that.
Or the usual tracking down the papers thing starting with one that talks
about it, and will have references.
http://seismo.berkeley.edu/~manga/folkner.pdf might give a start.
```

One of the footnotes mentions Viking data at S-band.

Journal of Geophysical Research (aka JGR) is where a lot of this seems
to show up.

You could search for works by authors who do this kind of thing, too.
Folkner, Asmar, Oudrhiri, Iess, Armstrong are all worth searching for.
I'd do a search for the author name AND "ranging"

For more "raw data" try the NASA Planetary Data System archive
http://pds.nasa.gov/

You're going to be on your own to find the relevant data files. Try
"radio science" as a search term.

Probably is possible to measure the optic signal from the Mars satellite. If
yes, we have the direct comparison light - radio waves.
Radio transmitter can be installed only on the Mars.
>

For me will be enough your steatment if speed of light and radio waves were measured in different regions of the Solar System.
Katz: http://ipnpr.jpl.nasa.gov/progress_report/42-65/65I.PDF
wrote that the electron temperatures are from 10^4 to 10^6. Look at Fig 2.
Place the Mars instead a spacecraft. Between (a) and (c) should be some differences.

You wrote: " NASA knows the results. Are they published? Of course, they're published. Widely."

What the conclusion are?
I do not need the quantitative data.

I'm sorry to say that working for a living gets in the way, of my important
to me work :-)
Add to that a few household projects, such as building a fence around one
side of the house,
and some other minor repairs, I haven't had much time.
I'm still on a quest for a high Q inductor of about 240uh. I hope to hit
2000. That involves
building a new polystyrene frame and two or three bundles of 660/46 litz
wire.
I still want to finish the high input impedance amp I had questions
about. I have three PCB's
with the basic amp so one will be with a 0,3pf input cap to 20 Meg and a fet
gate. Another
will be a bootstraped input which as I understand, should be better. The
third is unknown,
If I get the bootstrap working well, I may finish the third and try to sell
it on a crystal radio group.
Summer is the busy time for my business, so I won't get much important
work :-) done for a while.

I have a flag antenna up in my yard.
http://i395.photobucket.com/albums/pp37/Qmavam/P1010128-1.jpg

(Basic Flag antenna info, if your not aware,
http://www.hard-core-dx.com/nordicdx/antenna/loop/flag/index.html)

When I built the antenna, the idea was fairly new and I figured there would
be some changes to the design,
with that in mind I built it so I could tilt the crossbeam for easy access
to the matching transformer and
termination resistor. This assembly allows me to tilt the crossbeam.
http://i395.photobucket.com/albums/pp37/Qmavam/P1010135.jpg
By pulling on a rope, the pin slides and allows the tilt.
The mast is also on a rotor.
http://i395.photobucket.com/albums/pp37/Qmavam/P1010129.jpg

There have been a few improvements, such as the Waller,
http://www.n4is.com/waller/BIG_DUAL_LOOP.html
But I have made any changes to mine.
Time to get to work.
Later, Mike
PS. have ya seen my electric gokart? :-)

I don't think that there is any way to "see" a satellite at Mars.
Perhaps if one did some sort of Moon/mars occultation?

> Radio transmitter can be installed only on the Mars.

There are precision transmitters suitable for this kind of measurement
at many places in the Solar System.

I'll assert that propagation through interplanetary space is moderately
well understood and matches all modern models of electromagnetic behavior.

Are you asking if the calculations in Katz's paper for the two paths
have been experimentally verified? I don't know..
Certainly he predicts that the temporal dispersion is going to be <0.1ps
for near IR, which is, shall we say, challenging to measure.

I'm glad Joel said "almost always." Be aware that shielding a
solenoid coil will drop its inductance (and its Qu), and thus raise
the resonance. So if you've designed a filter for a frequency well
below the self-resonances of the coils, and measure the coil
inductances without shielding, you may well find that the resonances
are higher than you expect when you put the resonators into shields.

Further to what Joel said: at least in Spice, you can add whatever
parasitic elements you want, and that can be valuable to understanding
why your real filter isn't behaving like the simple model said it
should. Recent versions of Elsie include the ability to write an
LTSpice output that opens into a nice schematic in the LTSpice
program, and lets you then play with modifying coil Q and adding
parasitic elements (including inductor-to-inductor coupling) to your
heart's content.

I agree that the NuHertz filter design software is very good, if
you're willing to pay for the full version. You can also get very
good filter design help in Agilent's ADS software, but they you'd
really have to live on rice and peanut butter for a looonnngg
time. ;-)

Cheers,
Tom

measuring things to tenths of a picosecond, repeatably, can be tricky..
That's like measuring the phase difference between two 10 GHz signals
to 0.3 degrees. Or, another way to look at it is 1 picolightsecond is
about a third of a millimeter.

You're looking at
a) figuring out how to generate two signals at near IR that has a
frequency offset that can be accurately controlled. Probably some sort
of heterodyne mixing scheme would be easiest.
b) sending those two signals over the optical path through
interplanetary space.
c) recovering the signals, measuring the propagation time variation
(say, by looking at the phase difference between the modulation
signals), and then removing atmospheric effects.
d) it's probably going to be a pretty weak signal, so you'll need to
average. That means your measurement system has to be picosecond stable
over the averaging interval.

None of those steps are particularly simple or easy.

I've worked on systems to measure the (microwave) distance to Jupiter
and back with an accuracy of around 1 part in 1E15 at 32 GHz,
integrating over 1000 seconds. That's tenths of a picosecond out of 1000
seconds. It's challenging.

Yes, the mast is metal, and the wire is insulated. At the
present time I have
450 ohm ladder line running around the frame as the antenna. I
used that because
I had a thought about some type of phasing between the two
wires, but I have not
done anything further.

Here's a video, that's about 2 years old. I have since put new deep cycle
batteries on it.
It has a lot of torque, the kids love to do donuts, ok, I do too!
I smoked the first motor after a year or year and a half. Actually the
motor was ok, but

a connection between one 4 gauge wire and eight 16 gauge wires overheated
and created
a lot of smoke. I had a second motor, so I made another motor mount and put
it on.
This started as a project to get my 16 yr old son to build something
instead of play video games.
It was more my project than his, but I had some time with him and he learned
a little, so I'm glad
I did it. He is too.

Gotcha.

When you mentioned go cart earlier, I was thinking golf cart. That's why I thought they were all electric. Now that I have my head on straight, I see that your go cart is an impressive little machine.

Good work.

A third of a millimeter is no big deal and for an optical (or
sub-optical) signal - trivial. Perhaps, when stated in terms of two
10 GHz signals, "near IR" is being vastly over stated.

>You're looking at
>a) figuring out how to generate two signals at near IR that has a
>frequency offset that can be accurately controlled.

Controlled? This is dreaming in technicolor (or near IR color) if the
source is celestial.

I thought the discussion was about dispersion, the characteristic of
the medium, not sources.

>Probably some sort
>of heterodyne mixing scheme would be easiest.

Heterodyning is extremely commonplace and accurate - why would it be
pondered as an alternative method?

>b) sending those two signals over the optical path through
>interplanetary space.

This blurs my understanding of celestial where two signals is a
poverty of what is available from ANY celestial source.

>c) recovering the signals,

If there is a problem of recovery, it seems it is more a practical
matter of source selection. Given the billions of celestial sources
available, I don't understand the problem.

>measuring the propagation time variation
>(say, by looking at the phase difference between the modulation

OK, so I am lost. This laundry list of difficulties seems to be
prepared to anticipate failure.

Name the near IR source and defend its choice in light (no pun) of
these intractable difficulties.

>None of those steps are particularly simple or easy.
>
>I've worked on systems to measure the (microwave) distance to Jupiter

32 GHz is what photonics would call far-far IR at roughly 3 to 4
orders of magnitude distant from "near IR."

>seconds. It's challenging.

No doubt - like trying to push a peanut up Pike's Peak with your nose.
That too has been done with challenge in mind.

How did this slip from "near IR" to 32 GHz?

> How did this slip from "near IR" to 32 GHz?

Hello Richard!

I'm back, and I see the old neighborhood hasn't changed much, although I haven't seen anything from Art - hopefully the chap hasn't had a bed turn.

Here is a question or two for those who have some doubt as to the speed of light.

A probe recently inserted itself into orbit around Mercury. How does some presumed superluminal velocity affect the insertion?

The idea that "we" have a transmitter on Mars notwithstanding, Jupiter has been transmitting RF for a long time. There are enough other spacecraft running around in our solar system, and certainly if radio waves traveled at some other velocity than what we thought they did, it would mean a strange and useless conspiracy to hide that fact.

Cue up the twilight zone music and grab your aluminum foil hats everyone.

Somebody wrote that the data from the Mars are available. But it is not easy
to find them.

Since data from Mars is less than 150 years ago I doubt you would read it
and I know you wouldn't understand it if you did.

Hello Mike,

Welcome back to the Land of Odds.

>The idea that "we" have a transmitter on Mars notwithstanding, Jupiter
>has been transmitting RF for a long time.

Jupiter was one of my first DX goals back in the early 60s. However,
to expand upon your offering (I was wondering when anyone would
mention these sources), Earth, too, is a natural RF source (to
distinguish from the unnatural - such as stations carrying Fox Noise).

Quoting Wikipedia on Jupiter (nothing much said of the other planets
other than Earth):
"The intensity of Jovian radio emissions usually varies smoothly with
time; however, Jupiter periodically emits short and powerful bursts (S
bursts), which can outshine all other components. The total emitted
power of the DAM component is about 100 GW, while the power of all
other HOM/KOM components is about 10 GW. In comparison, the total
power of Earth's radio emissions is about 0.1 GW."

("emissions in the range 3 to 40 MHz are referred to as the decametric
radiation or DAM")

This decametric radiation would put us (returning to my quoted
question above) another several orders of magnitude beneath "near IR"
and into the "frigid IR" (a distinct irony with temperatures hovering
in the hundredths of a degree K).

Hello Jimmie,

I think it will be OK, but if you want to be 100% sure, make a dipole
of same thickness tubing and one from the threaded material of choice.
If results are same, you can use it without dimension scaling. Are
you using galvanized or alu material?

If required, apply some corrosion protection.

With kind regards,

The reference to 10 GHz was to try and relate the problem at Near IR
to something more familiar (since I suspect that most r.r.a.a are more
familiar with RF than light) (since speed of *light* was being
discussed, and the reference cited referred to optical communications
at Near IR)

>

The figures in the referenced paper showed a manmade source,
presumably with some sort of source which could be designed to make
measuring dispersion easier.

>
> I thought the discussion was about dispersion, the characteristic of
> the medium, not sources.

Precisely.. but if you're going to measure dispersion, you've got to
have a way to do it, and sending out two signals that are coherent
with each other at a known offset seems to be a fairly straightforward
approach.

>
> >Probably some sort

> >of heterodyne mixing scheme would be easiest.
>
> Heterodyning is extremely commonplace and accurate - why would it be
> pondered as an alternative method?

For optical signals, there could be other ways to generate multiple
signals at different frequencies that are coherent with each other. I
don't know enough about optical measurement techniques. I *do* know
that you can modulate near IR with RF signals using a variety of
techniques.

>
> >b) sending those two signals over the optical path through

>
> This blurs my understanding of celestial where two signals is a
> poverty of what is available from ANY celestial source.
>

Back to the figure reference.
And, of course, getting coherent signals from a celestial source might
be a challenge. I don't know.. maybe some sort of clever correlation
technique in an interferometer would do. Not really my field.
> >c) recovering the signals,
>
> If there is a problem of recovery, it seems it is more a practical

> >signals), and then removing atmospheric effects.
>
> Why worry about the atmosphere when you can get above it?

Indeed. That would make things easier, and is something that people
want to do. But so far, we're stuck with just sending the transmitter
out there.

>

> prepared to anticipate failure.

Not so much failure, but that the original question asked for
experimental data to confirm a fairly well understood effect. My

point is to show that collecting that experimental data is non-
trivial, and not something that you can just rig up in your backyard
with baling wire and sealing wax.

>

Well.. yes, it *is* hard, but if you want to know the internal
structure of another planet, it does take some work.

>
> How did this slip from "near IR" to 32 GHz?
>

The example of 32 GHz is to illustrate that I am not just speculating
about the difficulties of doing it at IR. I have personal knowledge
of how hard it is at 32GHz, and I'm pretty sure it's harder at Near
IR.

So someone on a listserv or usenet group who's looking for a "hey I
did the experiment yesterday, and sure enough, dispersive media have
dispersion" isn't going to get it. Nor are they likely to find the
results of someone who might have done it for real without digging a
bit.

It would be difficult to make measurements of dispersive propagation
in the interplanetary media using the natural emissions of Jupiter,
since you don't have knowledge of the relative phases/timing of the
emissions at different frequencies, so you have nothing to compare
against on earth.

If you had two receivers in space separated by some distance along a
line from Jupiter, maybe you could do it. If they're on earth, I
think the ionospheric variation would dominate your measurement.

That said, at least you can get a big frequency ratio so the 1/f1^2-1/
f2^2 term would be large.

Maybe the folks building LOFAR have some clever ideas on compensating
for the ionosphere and they will be able to use Jupiter as a source
for this sort of measurement (if they're interested.... I suspect
they're not..)

592. wind seems to have stopped

Hi Jim,

We would first have to agree what "dispersion" means.

If it conforms to optical dispersion (this having started, at least
for me, in the near IR, which is optical as far as I am concerned),
then the wide bandwidth (offering us with many time coherent sources)
through a frequency dependent media would present different phase
shifts which could then be cross-correlated. Modal dispersion might
present a problem because even though Jupiter is far away, it still
presents a significant arc of span across space (i.e. not even close
to being a point source).

Hi Jim,

The display and measure of Newton's rings is exceedingly trivial for
optical time/phase/freq/distance differences far shorter in shift (nm
to um) than what is being described here (in mm).

Galvanized, The pupose was to demostrate that materials can often be
adlib and still have a useable antenna. Maybe this one will not last
30 years before it corrodes away but probably 5 or 6. Also I want to
demonstrate the value of using a jig when building many antennas all
made the same. I have tried the test you mention on 10 meters before
replacing a vertical mounted on my truck. Changing materials didn't
seem to make much difference. WIll try the same for 2M but I dont
have an SWR meter for 2M at this time.. Was hopng someone in the group
might think this interesing enough to try.

I made a j-pole from galvanized steel. It worked beautifully. When I
replaced it with a commercial antenna I notice very little change in
performance and signal strength. I had hoped my kluge was deficient in
performance compared to the commercial antenna. Didn't seem so. My QTH

was way out in the country side about 20 miles from the nearest repeater.

Just a story for you, no hard data. Sorry.

John

Hello Jimmie

Zinc has about 60% conductivity of alu alloys that are used for antennas, so the surface resistance will be almost 80% of alu tubing (same diameter). Of course you have thread that increases the path length. Given the thread, your net conductivity will be about 40% (w.r.t. alu).

This will be OK for doing your experiments and to demonstrate that you can use many materials for antennas. I would recommend you to find some means to determine VSWR (or refl. coeff.) at 2m (home made slotted coaxial line, or home brew coupler?).

With kind regards,

Wim

Unless you can tell the differance in a few tenths of a dB, almost any
conductive material will work for simple antennas if the diameter is large
in terms of a wavelength. If the antenna is built the same or vary similar
to a comercial antenna, you usually don't notice any differance.

Lots of money is spent on the comercial stuff for little or no improvement.
Problem for many is buying the materials. If you only need a small ammount
of material , you often have to buy a lot.
Then not everyone has the machinery to do the building.

Of course. My response is aimed at the OP's subject line. I'm trying to
be encouraging.

I bought a long piece of chain link fence top rail for the mast and a
piece of conduit for the 1/4 wave element. I used a hacksaw and a drill
to do the machining. I used automobile hose clamps to connect the
transmission line to the kluge. It worked well for about 10 years until
high winds bent the mast (chain link fence top rail is not that stiff).

Hello John,

I made (and still use) same type of wheatstone bridge refl. coeff.
meter with BAT15 diodes (so only low power) and 0805 SMD. Instead of a
moving coil indicator I used a 10 MOhm DVM (to get better linearity at
low power input).

Such a simple device is very useful. Only limitation is that you can't
have it in between during normal operation as you have 6 dB insertion
loss.

Hello John, Jimmie and others,

If the DC input resistance of the DVM is very large compared to the zero bias differential resistance of the diode, there is a tight relation between DC output voltage and the RF input voltage with reasonable temperature behavior.

If you measure the RF to DC curve at about 5 RF input levels (at say 10 MHz, just with an oscilloscope and simple RF signal source), you can make a curve fitted table/graph to handle the linear to quadratic transition at around 150mV RF peak voltage. This enables you to convert DC output to RF input voltage. You can expect about 1mV DC

from a real schottky diode for 10mVp RF input voltage (across the
diode junction).

Hi OM Chris,

Focus is on shunt feed wich gives the discharge path for the static.

This is not possible with the 1/4 wave since there is no matching coil.

Many thanks.

But you could put a 1 Meg resistor(or a RF choke, for that matter)
across the feed to discharge static with almost no effect on RF performance.

One of the other advantages of a 5/8 long radiator is that the pattern
is slightly "flatter"... it would show up on an antenna range or a
model, but on an actual vehicle, it might not make as much difference

Hi OM Jim,

I agree with you on all points.

For working mobile, an antenna radiating at higher angles is preferable
since
base station antennas would be at a height and repeater antennas even
higher.

On the other hand, for the base station, a flatter antenna pattern would
help
while working mobile stations (e.g a Slim Jim would be better than a
GP).

Maybe in the Los Angeles area close to the 5000 ft high mountains the repeaters would be be high up, but I think for the vast majority of cases, the vertical elevation angle to a repeater would be pretty low (<10 degrees).

Consider a repeater on a 100 meter tower. If you're more than 1 km away, it's less than 6 degrees above the horizon. If you're within a km, you're close enough you don't need the gain.

610. Helically-wound Monopoles

Newsgroup: rec.radio.amateur.antenna

A few years ago there was some discussion on r.r.a.a. about helically-
wound, normal-mode monopoles, and the rather common expectation that
they had higher gain than a linear monopole of the same physical
height (and with other things equal).

A recent NEC-2 analysis of this topic might be of interest:

Kraus' short resonant normal-mode helical antenna uses close to 1/4WL
of conductor. We know that because of adjacent turn coupling, when a
conductor is coiled into a helical configuration, more conductor is
required to maintain a constant electrical length, e.g. 90 degrees in
this case. I suspect that Kraus' helical antenna example would be
resonant at about 1.8 times the design frequency rather than at the
design frequency. Please note the last line in the Kraus quote
regarding the advantage of a helix.

Since a helical monopole is 90 degrees long at the design frequency,
one wonders if half of the helix would be 45 degrees long at the
design frequency? And if the missing half of the antenna were replaced
by a whip to return to the original resonant frequency, why wouldn't
we have a base loaded antenna with the base loading coil occupying 45
degrees?

Hello Richard,

Maybe there is confusion between gain and directivity.

When there is no change in the phase of the current, and overall
physical length << 0.25 lambda, directivity will be 1.76 dBi (or 4.76
dB over perfect electrical conducting ground).

I can imagine that part of the matching can be in the helix (lots of
copper) so that the ohmic loss may be less w.r.t. to a lumped coil at
the feed point. If so, the gain of the helix can be higher.

If you can make the helix electrically longer then 0.25 lambda (so
that current maximum is not in the feed point, but for example in the
middle), directivity will not change, but ground loss will reduce as
the helix will have high Re(Zin).

Hello Szczepan,

Search for the effective permittivity of media with free electrons
(plasma). You will see that the effective permittivity changes with
frequency, hence the phase velocity. Don't look strange to find
apparent permittivities below the value for vacuum.

Just ignore DC magnetic field as this complicates that math
significantly.

I was always under the assumption that the helical whip was
less efficient than the same height whip loaded with a lumped coil.
I NEVER thought the helical whip had the advantage. And so far my
experience with the mobile whips seems to show that an efficient
lumped coil has the advantage.
>
> A recent NEC-2 analysis of this topic might be of interest:
> http://i62.photobucket.com/albums/h85/rfry-100/Helix_vs_Linear_Monopole.gif

Where is the coil on the linear monopole? Seems to be a flawed
example to me. The helical example is loaded, but the linear is not?
What kind of comparison would that be to jive with the real world?
Of course, most will find that the location of the lumped coil
on a whip will effect efficiency and current distribution.
IE: the center loaded whip will generally have an advantage over
a base loaded whip.

A helical loaded whip can be a decent antenna, but I've always
had better results using the lumped coil.
Also, a helical whip needs some capacitive loading "IE: decent
length whip above the helical windings" to live up to it's
expectations. The helical whips with windings all the way to
the top doesn't do so well.

Also, the manner in which a helical whip is wound will effect
current distribution. It's best to maximize the windings near
the top rather than use a constant pitch the whole whip.
Much in the same manner that a lumped coil whip usually does
better with a center or higher mounted coil vs a base load.

If a helical winding was as efficient as a lumped coil, I
would not have converted my helical wound whips to lumped
coils. And if this were true, I would not have noticed any
difference when I did. But I did notice a difference.
So I think I will stick with the lumped coils.

I don't foresee a mad rush by the bugcatcher users to
convert to ham sticks any time soon. :/

>Since a helical monopole is 90 degrees long at the design frequency,..

It may have ~ zero reactance, as does a linear ~ 90-degree monopole, but the helix will not have the radiation resistance of the linear version, as John Kraus pointed out in the linked page.

Radiation resistance is a function of the end-end length of the helix and the frequency, whether the helix is self-resonant or not. The radiation resistance of the resonant helix in Kraus' example is much lower than that of a series-fed, 1/4-wave, linear monopole.

Hello Wim,

So you confirm that in plasma is the same as in metal.

But what with the space. The AM should be better than FM to communicate with
the Mars.
Is/were FM used for long distances?

Were done the proper experiments in the early years of radio?

Regardless of the loss in a loading coil for the linear monopole (and actually the helix would need one also), the salient point here is that even though the conductor in the helix is 3.14 X longer than in the monopole, the radiation resistance and pattern of the two forms for a given frequency is the same for the same end-end length -- as shown in the comparison.

It is the relation of the radiation resistance to the other resistances (mainly the matching network loss and the r-f ground terminal loss) that determines the radiation efficiency of the complete antenna system.

Some might think that the radiation resistance of the helix in this model is determined by the length of the conductor from which it is wound, but that isn't the case.

And what they tell:
"Because of the low signal-to-noise ratio, as with amateur-radio practice, EME signals can generally only be detected using narrow-band receiving systems. This means that the only aspect of the TV signal that could be detected is the field scan modulation (AM vision carrier). FM broadcast signals also feature wide frequency modulation, hence EME reception is generally not possible. There are no published records of VHF/UHF EME amateur radio contacts using FM." From:
http://en.wikipedia.org/wiki/TV_and_FM_DX

Could you explain it?

S*

> Is/were FM used for long distances?

As power is limiting factor, a modulation scheme with coherent
detection and digital decoding will give best performance (best Eb/N0
ratio for certain BER) I think. So it is not just a question of AM or
FM/PM, but more how it is processed at the receiver. Processing power
changed over time, so theoretically the best method may not be used
because of technical limitations.

Yes, I thought that was the purpose of your posting. As Kraus said,
the helical has an advantage over a short straight conductor - same
radiation resistance with less reactance. The radiation resistance of
a 6" long Texas Bugcatcher coil is approximately the same as a 6"
piece of wire.

We agree on that point, Cecil.

But if, as if you posted earlier, "a helical monopole is 90 degrees long at the design frequency," are you claiming that such a short, self-resonant, normal-mode, helical monopole has the same radiation resistance and system performance as a self-resonant linear monopole of about 1/4 of a free-space wavelength (other things equal)?

And if you do, could you please explain why this approach was not adopted many decades ago for use by AM broadcast stations?

I have a relative in the communications business who would tell you to
throw it away.
The reason is - unless you are going to hook it up to a junk radio
-there is no reason to use a junk antenna unless the radio is of no
value to you.

Moores law tells me that it is probably past it's prime and it probably
isn't going to last very long anyways.

A friend of mine has a antenna that sounds identical to the one you are
trying to repair and the lengths on his antenna looks to be 12 inches.

I have not taken it down to physically measure it, but we are about to
move it in a month or two and if you still need the exact measurement -
I will get it for you.

I am surprised that the manufacturer didn't offer give you the
dimensions.

When you put a losless inductor in series, gain and radiation pattern
doesn't change, so the simulation is useful.

The helical requries less series inductance as the capacitive
component is less (-j2080 versus -2970), so you save on the inductor
loss (for the helical case).

For me, the disadvantage of the helical is the thickness and weight of the construction.

No, not at all. The problem with all the folks who have these strange desires to debunk basic physics is this:

Things are connected.

When people come up with theorys/conspiracies or whatever that sopmething we thought we knew is so completely wrong, it is a mark of thier ignorance that they don't realize that there is more than one thing negated if they are correct. Want a different speed of radio compared to light - or rather I should say faster than C ? Better be prepared to abandon most of what we already know.

So in the end, we're left with either a remarkable ignorance, willful stupidity, a creationist agenda, or else that ever loving fun interactive game of arguing with the computer.

As power is limiting factor, a modulation scheme with coherent
detection and digital decoding will give best performance (best Eb/N0
ratio for certain BER) I think. So it is not just a question of AM or
FM/PM, but more how it is processed at the receiver. Processing power
changed over time, so theoretically the best method may not be used
because of technical limitations.
>
> Were done the proper experiments in the early years of radio?
> S*

Best regards,

Wim

I am simple asking if radio people have trouble with the fact that the speed
of waves are frequeny dependent.
I am interesting with the real radio waves in the real media. Here is an
example Pulsars are spinning neutron stars that emit pulses at very regular
intervals ranging from milliseconds to seconds. Astronomers believe that the
pulses are emitted simultaneously over a wide range of frequencies. However,
as observed on Earth, the components of each pulse emitted at higher radio
frequencies arrive before those emitted at lower frequencies. This
dispersion occurs because of the ionised component of the interstellar
medium, which makes the group velocity frequency dependent

Sorry, I forgot to address this question directly. Both radiators were base fed.

As shown at the top of that comparison page, a total of 30 ohms was included in each NEC model to account for the loss in the connection to r-f ground, and in the loading coil. That is why the maximum gain of both models is about -19.5 dBi, rather than 4.77 dBi.

We have the two C. One of them is a constant in the wave equation.
The second is a speed of light. It is different in different media and the
frequency dependent. Also in space. An example Pulsars are spinning neutron
stars that emit pulses at very regular intervals ranging from milliseconds
to seconds. Astronomers believe that the pulses are emitted simultaneously
over a wide range of frequencies. However, as observed on Earth, the
components of each pulse emitted at higher radio frequencies arrive before
those emitted at lower frequencies. This dispersion occurs because of the
ionised component of the interstellar medium, which makes the group velocity
frequency dependent.

Absolutely not. I am claiming that a 1/8WL long *resonant* helical is
electrically 90 degrees long and has approximately the same radiation
resistance as a 1/8WL straight piece of wire. Radiation resistance and
linear *physical* length are correlated. Radiation resistance and
electrical length are NOT correlated. As I said previously
(concerning standing wave antennas) the feedpoint impedance is
associated with the electrical length of the antenna. Radiation is
associated with the physical length of the antenna.

Try to find document "Descanso4--Voyager_new.pdf" (very likely the
first result in google). This describes the Voyager communication
system. It is now more the 10 light hours from us (as far as I

know).

As far as I know, they don't equalize to correct for in band dispersion (due to wave propagation). Maybe other people have better info on this.

Best regards,

Wim

They used the "Ultrastable oscillator".
They measure the ions and electrons density in the interstellar medium. So
the band dispersion is obvious and the only remedy is the "Ultrastable
oscillator".

So AM and FM are quite opposite. It seems to me that FM is not the best for
the long distances.

It seems to me that here is a confirmation of that: ""Because of the low
signal-to-noise ratio, as with amateur-radio practice,
EME signals can generally only be detected using narrow-band receiving
systems. This means that the only aspect of the TV signal that could be
detected is the field scan modulation (AM vision carrier). FM broadcast
signals also feature wide frequency modulation, hence EME reception is
generally not possible. There are no published records of VHF/UHF EME
amateur radio contacts using FM." From:

http://en.wikipedia.org/wiki/TV_and_FM_DX

I do not understand this but guess.

Best regards,

S*

Cecil,
You frequently embed comments in your posts that I find especially
important to antenna basics.

I am starting a list of Antenna Axioms with this:

"Radiation resistance and linear *physical* length are correlated.
Radiation resistance and *electrical* length are NOT correlated. As I
said previously (concerning standing wave antennas) the feedpoint
impedance is associated with the electrical length of the antenna.
Radiation is associated with the physical length of the antenna.
--
73, Cecil, w5dxp.com"

As a student of antennas I do appreciate your stating the basic
principals in answering questions.

There are a lot of Hams who still think a short resonate dipole is
just as good as a full size dipole.

That would be true if everything was lossless. Unfortunately in the real world, a short dipole *system* almost always suffers more overall losses than a well-designed full size dipole *system*. In general, the shorter the dipole, the greater are the losses in the process of transferring energy from the source to the load. Short dipoles are indeed efficient radiators of the *energy delivered to the antenna*. The loss problems are in the energy transfer/delivery systems, not in the energy radiating system.

The reason that a high-Q center loading coil system has less loss than a 100% helical system is interesting. The impedance discontinuity at the loading-coil/whip junction yields a lossless phase shift that contributes to the electrical length of the antenna. It is a rare "something-for-nothing" gift from the Antenna Gods. :)

No, they are not because the speed of electromagnetic waves is NOT frequeny dependent, the speed is media dependent, you babbling, ignorant, trolling, moron.

> the Mars.
> Is/were FM used for long distances?
>
Today, phase modulation (BPSK, QPSK) is used for space. The primary driver for this is the desire for a constant envelope modulation that works with a saturated amplifier, for DC power efficiency reasons. It's also the best way to send information with a limit on peak power (i.e. the peak/average ratio is 1, and the SNR is constant)

BPSK with a non-180 degree phase shift (i.e. the carrier isn't totally suppressed) is used to allow acquiring and tracking the carrier in a low SNR environment. The carrier is tracked with a <1Hz BW tracking loop, and used to generate the return signal from the spacecraft in a coherent way. At X-band, the transmitted frequency is 880/749 times the received frequency. That carrier tracking and precise phase measurement is used to do accurate ranging and doppler measurements, which is how we know where the spacecraft is and make science measurements (e.g. precise orbit determination lets you infer the internal structure of the body about which you are orbiting, propagation measurements let you measure the properties of interplanetary space or the atmosphere of the body when you go into occultation, etc.)

recognize that deep space communications is probably one of the areas where modern technology gets closest to the Shannon-Hartley limit in low SNR environments. We may not be doing so hot in the bps/Hz high SNR area (where 64 QAM and similar things are popular), but in the "make it work on the ragged edge of detectability" we do pretty well.

The DESCANSO web site (http://descanso.jpl.nasa.gov/) has a variety of reports and books available for online/download/free use that discuss a lot of this stuff. Pretty much all the missions JPL has done in the past few decades have a "design and performance" report out there that describes the radio system and how it works. The monograph series has a bunch of books on some general aspect (like large antennas or autonomous radios).

the IPN progress reports (which has had various names over the years) is more a peer reviewed journal of record for various work in space communication, and all of it is freely downloadable, too.

>

No compensation is made for dispersion.. the bandwidth of the signal is so narrow compared to the carrier frequency that dispersion in propagation isn't a factor. The bumps in the group delay characteristics of the radio components are orders of magnitude greater. To minimize that, we tend to use designs that keep the signal in the nominal center of the IF passband.

Where dispersion becomes interesting (and is actually measured) is when comparing signals at two separated frequencies, e.g. 8.4 GHz and 32 GHz. Or, for a closer to earth example, L1 & L2 for GPS (separated by a couple hundred MHz at 1500 MHz) allow for compensation for ionospheric delays.

Sorry, I don't see the link between "ultrastable oscillator" and
dispersion. Good oscillators in both transmitting and receiving
equipment are required to get the lowest possible Eb/No for your

digital modulation scheme.

Low bit rates, result in low required power, so it is true that with
the advent of low bitrate digital schemes, EME is within the reach of
more radio amateurs. As these modes use narrow bandwidth, dispersion
effects are negligible when looking to the demodulation of the
received signal (as far as I know). Even amateurs using satellite
communication with analog voice, don't have to modify their
demodulators.

The USO has nothing to do with the dispersion. It's just something
that lets you make the measurement, because you can integrate over
100s of seconds, and know that the signal being transmitted didn't

change (much) during that time, so any changes are due to the
propagation.

I don't know that I'd use a wikipedia article as my primary reference
on this particular topic.

The reason hams don't do EME FM or EME TV is more a matter of link
budgets than propagation characteristics. amateurs are limited in the
maximum output power (e.g. 1500W PEP in the U.S.), and particularly if
they're using amateur antennas (no 300m dish at Arecibo), you don't
have enough radiated power density to send a wideband signal and have
it arrive back at earth with decent SNR. So, hams use narrow band
transmissions and narrow band receivers (so that they get the minimum
noise power in the detection bandwidth). (also, there's a cultural
thing.. the hams that are interested in TV aren't the same hams
interested in moonbounce, so there's not necessarily and motivation to
even try what would be a fairly difficult and expensive stunt)

If you're not limited by amateur budgets or regulatory power limits,
there's no reason you couldn't send FM or TV to the moon and back.
Apollo used FM in their Unified S-band system (granted, one way from
the moon, not a moonbounce). I haven't run the numbers, but maybe if
you had a big enough transmitter, and used something like Arecibo, you
could do moonbounce tv.

We send several MHz bandwidth back from Mars with a 100W transmitter,
a 3 meter dish, and receive it with a 34 meter dish on earth at
greater than 0dB SNR.

A big advantage of AM is that it has simple and cheap transmitters (a
modulated amplifier) and receivers (a diode). If you're spending
billions of dollars to send a probe to Mars, saving (relatively) small
amounts on the radio isn't worth it, especially if you have to spend
large amounts more on solar panels to get the additional DC power
needed.

That said, for short range links in space, FM, FSK, and AM are
considered as viable alternatives, especially where you are looking

for very small, very low mass. The Muses CN rover (which was about the size of a pack of cards and was going to drive around an asteroid's surface) was proposed to use a FSK data link, as I recall. AM for astronaut backup voice comm is also a possibility.

Are you looking for a comparison between the antennas? For most horizontally polarized low/medium gain antennas (which those are), the vertical (elevation) pattern is going to be almost entirely determined by the height above ground (so there won't be much difference)..

There is a formula (which I can't recall off the top of my head) which would give you the elevation angle of maximum gain for a given height. You might want to invest in a copy of the ARRL Antenna Book, which includes a program called HFTA which does the calculations and lets you do a lot of cut and try.

It is what I was looking for.
Speed of all waves are frequency, amplitude and temperature dependent.
I realize that for radio waves the effects are small. It seems that for
radio amateurs too small.
GPS is extremely precise and there the effects must be measured.
Thanks you very much.

Hello Jim,

Given a certain medium, both phase and group velocity can be frequency dependent (example: ionosphere).

DRM uses OFDM to achieve very low baudrate to mitigate the dispersive behavior of ionospheric propopation. A least 88 subcarriers are in 10 kHz bandwidth.

No, I already bought these antennas last year when I was very sick, so
I didn't check everything as I should have. I just wanted a close
number of degrees for the radiation angle. Cushcraft says they can't
hazard a guess. That's really poor. Just something close was all I was
after.

>> wall, and then backed his car into it, breaking the fiberglass radome
>> and bending the guts. I managed to unmangle the antenna and epoxy the
>> radome, but somewhere in the shuffle, the ground radials disappeared.
>> Duz anyone have an X50a handy that can measure the length of the
>> ground radials (from the aluminum base casting to the end)? The
>> current random length welding rods (with toothpicks jammed into the
>> holes) are not going to last.

>I have a relative in the communications business who would tell you to
>throw it away.
>The reason is - unless you are going to hook it up to a junk radio
>-there is no reason to use a junk antenna unless the radio is of no
>value to you.

Good advice, but doesn't apply in this case. I'm back into building
yet another repeater:
<http://802.11junk.com/jeffl/K6BJ-MSF5000/>
Due to a combination of club politics and my laziness, the repeater
will be tested at my house for a hopefully limited time.
Unfortunately, I couldn't find a suitable antenna and decided that the
trashed Diamond X50 was the least disgusting alternative to doing it
the right way. As long as it doesn't destroy the power amp with
excess VSWR, it should be fine for testing.

Various sympathetic friends have also offered to sell me spare
antennas. I could also build one (I'm partial to a center fed
Franklin/Amos antenna, but have only built these for 2.4Ghz, not
440Mhz).
<http://802.11junk.com/jeffl/antennas/AMOS-7/index.html>
But first, I need to finish some work, and complete my taxes.

>Moores law tells me that it is probably past it's prime and it probably
>isn't going to last very long anyways.

<http://en.wikipedia.org/wiki/Moore%27s_law>
Moore's law has to do with the number of xsistors on integrated
circuits, not the lifetime of my antennas and other abominations.

>A friend of mine has a antenna that sounds identical to the one you are
>trying to repair and the lengths on his antenna looks to be 12 inches.

I've seen several from the ground, but have been too lazy to climb the
towers or drop the poles in order to make the measurement.

>I have not taken it down to physically measure it, but we are about to
>move it in a month or two and if you still need the exact measurement -
>I will get it for you.

Thanks for the offer. I don't think it will be necessary but it would
be nice to know the real lengths. I fabricated some radials using
brass welding rods and found that the lengths are non-critical.
Scaling the length from a photo, I guessed high at about 10" and cut
them to 11". When I find the real dimensions, I'll cut them to size.

>I am surprised that the manufacturer didn't offer give you the
>dimensions.
>Diamond X50 - radial / part number 07003
>http://www.rfparts.com/diamond/x50a.html

Y'er right. I should have called RFparts.

Thanks much.

Hi OM Peter,

Many thanks for the link. Great stuff for the homebrewer!

73

Nandu.

Yes close to the Earth. But what is close to the Sun?

List of Solutions Manuals and Test Banks

---

contact me to : mattosbw1@gmail.com
mattosbw1(at)gmail.com

NOTE : "THIS SERVICE IS NOT AVAILABLE FOR : CHINA, INDIA, RUSSIA, PAKISTAN, IRAQ, IRAN, PHILIPPINES, NORTH KOREA, NEPAL, BANGLADESH, SRI LANKA, MALDIVES, BHUTAN & COLOMBIA".

If your wanted solutions manual is not in this list, also can ask me if is available (it is a partial list). Then if you need solutions manual only contact me by email.

"ARE NOT AVAILABLES BOOKS IN DIGITAL FORMAT", ONLY SOLUTIONS MANUALS AND TEST BANKS.

This same "list of titles" of texts with availables solutions manual and/or test banks is for download from :

http://www.megaupload.com/?d=ADDS77XH

I do not review the forums, just send me an email.

- Mechanics, Mechanical Engineering & Aerospace Engineering:

Solution Manual Classical Mechanics (Douglas Gregory)
Solution Manual Advanced Dynamics (Donald T. Greenwood)
Solution Manual Principles of Dynamics (2nd Ed., Donald T. Greenwood)
Solution Manual Advanced Engineering Dynamics (2nd Ed., Jerry Ginsberg)
Solution Manual Classical Dynamics (Jorge V. José)
Solution Manual Impact Mechanics (W.J. Stronge)
Solution Manual Statistical Mechanics (2nd Ed., R.K. Pathria)
Solution Manual Engineering Mechanics of Solids (2nd Ed., Egor P. Popov)
Solution Manual Introduction to Continuum Mechanics (4th Ed., W. Michael Lai, David Rubin & Erhard Krempl)
Solution Manual Analytical Mechanics (7th Ed., Grant R. Fowles, George Cassiday)
Solution Manual Introduction to Mechanical Engineering (Rizza)
Solution Manual Engineering Fundamentals and Problem Solving (4th Ed., Eide, Jenison, Mashaw & Northup)
Solution Manual Engineering Fundamentals and Problem Solving (5th Ed., Eide, Jenison, Northup & Mickelson)

Solution Manual Mechanical Engineering Principles (Bird & Ross)
Solution Manual Dynamics of Mechanical Systems (C.T.F. Ross)
Solution Manual Mechanics of Solids (C.T.F. Ross)

Solution Manual Advanced Topics in Finite Element Analysis of Structures : With Mathematica and MATLAB Computations (Asghar Bhatti)
Solution Manual Modeling and Analysis of Dynamic Systems (3rd Ed., Close)
Solution Manual Modeling and Simulation of Dynamic Systems (Robert Woods, Jr. & Kent Lawrence)
Solution Manual System Dynamics (1st Ed., William J Palm III)
Solution Manual System Dynamics (2nd Ed., William J Palm III)
Solution Manual System Dynamics and Response (S. Graham Kelly)
Solution Manual System Dynamics for Engineering Students : Concepts and Applications (Nicolae Lobontiu)
Solution Manual Dynamic Modeling and Control of Engineering Systems (2nd Ed., J. Lowen Shearer, Bohdan Kulakowski, John Gardner)

Solution Manual System Dynamics : Modeling and Simulation of Mechatronic Systems (4th Ed., Karnopp, Margolis & Rosenberg)
Solution Manual Concepts and Applications of Finite Element Analysis (4th Ed., Cook, Malkus, Plesha & Witt)
Solution Manual Finite Element Modeling for Stress Analysis (Robert Cook)
Solution Manual Fracture Mechanics : Fundamentals and Applications (2nd Ed., T.L. Anderson)
Solution Manual Mechanical Behavior of Materials (3rd Ed., Dowling)
Solution Manual Mechanical Behavior of Materials (W.F. Hosford)
Solution Manual Mechanical Behavior of Materials (Keith Bowman)
Solution Manual Theory and Design for Mechanical Measurements (4th Ed., Figliola & Beasley)
Solution Manual Theory and Design for Mechanical Measurements (5th Ed., Figliola & Beasley)
Solution Manual Mechanical Measurements (6th Ed., Beckwith, Marangoni & Lienhard)
Solution Manual Measurement and Data Analysis for Engineering and Science (Patrick Dunn)
Solution Manual Design and Analysis of Lean Production Systems (Askin & Goldberg)
Solution Manual Computer-Aided Manufacturing (3rd Ed., Tien-Chien Chang, Richard A. Wysk, Hsu-Pin Wang)
Solution Manual Work Systems : The Methods, Measurement & Management of Work (Mikell P. Groover)
Solution Manual Automation, Production Systems, and Computer-Integrated Manufacturing (2nd Ed., Groover)
Solution Manual Automation, Production Systems, and Computer-Integrated Manufacturing (3rd Ed., Groover)
Solution Manual Fundamentals of Modern Manufacturing : Materials, Processes, and Systems (3rd Ed., Mikell Groover)
Solution Manual Fundamentals of Modern Manufacturing : Materials, Processes, and Systems (4th Ed., Mikell Groover)
Solution Manual Materials and Processes in Manufacturing (9th Ed., E. Paul DeGarmo, J. T. Black, Ronald A. Kohser)
Solution Manual DeGarmo's Materials and Processes in Manufacturing (10th Ed., E. Paul DeGarmo, J. T. Black, Ronald A. Kohser)
Solution Manual Principles of Metal Manufacturing Processes (Beddoes & Bibby)
Solution Manual Design for Manufacturing : A Structured Approach (Corrado Poli)
Solution Manual Fundamentals of Manufacturing (2nd Ed., Philip D. Rufe)
Solution Manual Engineering Materials Science (Milton Ohring)
Solution Manual Engineering Materials : Properties and Selection (8th Ed., Budinski)
Solution Manual Engineering Materials : Properties and Selection (9th Ed., Budinski)
Solution Manual Materials Science for Engineering Students (Traugott Fischer)

Solution Manual Essentials of Modern Materials Science and Engineering (James Newell)
Solution Manual Science and Design of Engineering Materials (2nd Ed., Schaffer, Saxena, et al)
Solution Manual Structure and Properties of Engineering Materiales (5th Ed., Daniel Henkel & Alan Pense)
Solution Manual Materials Selection in Mechanical Design (3rd Ed., Michael Ashby)
Solution Manual Materials Selection in Mechanical Design (4th Ed., Michael Ashby)
Solution Manual Materials : Engineering, Science, Processing and Design (1st Ed., Michael Ashby, Hugh Shercliff & David Cebon)
Solution Manual Materials : Engineering, Science, Processing and Design (2nd Ed., Michael Ashby, Hugh Shercliff & David Cebon)
Solution Manual Engineering Materials Vol. 1 : An Introduction to Properties, Applications and Design (3rd Ed., Michael Ashby & David Jones)
Solution Manual Engineering Materials Vol. 2 : An Introduction to Microstructures, Processing and Design (3rd Ed., Michael Ashby & David Jones)
Solution Manual Materials Science and Engineering : An Introduction (6th Ed., William Callister)
Solution Manual Materials Science and Engineering : An Introduction (7th Ed., William Callister)
Solution Manual Materials Science and Engineering : An Introduction (8th Ed., William Callister)
Solution Manual Fundamentals of Materials Science and Engineering : Integrated Approach (2nd Ed., William Callister)
Solution Manual Fundamentals of Materials Science and Engineering : Integrated Approach (3rd Ed., William Callister)
Solution Manual Foundations of Materials Science and Engineering (3rd Ed, Smith)
Solution Manual Foundations of Materials Science and Engineering (4th Ed, Smith & Hashemi)
Solution Manual Foundations of Materials Science and Engineering (5th Ed, Smith & Hashemi)
Solution Manual Introduction to Materials Science for Engineers (6th Ed., Shackelford)
Solution Manual Introduction to Materials Science for Engineers (7th Ed., Shackelford)
Solution Manual Introduction to Materials Science for Engineers - International Edition (7th Ed., Shackelford)
Solution Manual Manufacturing Facilities Design and Material Handling (3rd Ed., Meyers & Stephens)
Solution Manual Manufacturing Facilities Design and Material Handling (4th Ed., Stephens & Meyers)
Solution Manual Manufacturing Processes for Engineering Materials (5th Ed. Kalpakjian & Smith)
Solution Manual Manufacturing Processes for Engineering Materials - SI Units (5th Ed. Kalpakjian, Smith & Chih-Wah Kok)

Solution Manual Manufacturing, Engineering & Technology (5th Ed. Kalpakjian & Smith)
Solution Manual Manufacturing, Engineering & Technology (6th Ed. Kalpakjian & Smith)
Solution Manual Manufacturing, Engineering & Technology - SI Units (6th Ed. Kalpakjian & Smith)
Solution Manual Principles of Corrosion Engineering and Corrosion Control (Zaki Ahmad)
Solution Manual Steels : Microstructure and Properties (3rd Ed. Bhadeshia & Honeycombe)
Solution Manual Analysis and Performance of Fiber Composites (3rd Ed., Bhagwan Agarwal, Lawrence Broutman & K. Chandrashekhara)
Solution Manual Nanoengineering of Structural, Functional and Smart Materials (Mark Schulz, Ajit Kelkar, Mannur Sundaresan)
Solution Manual Applied Manufacturing Process Planning : With Emphasis on Metal Forming and Machining (Nelson, Schneider)
Solution Manual Mastering CAD/CAM (1st Ed., Ibrahim Zeid)
Solution Manual Principles of CAD/CAM/CAE (Kunwoo Lee)
Solution Manual Computer Numerical Control : Operation and Programming (3rd Ed., Stenerson & Curran)
Solution Manual Introduction to Computer Numerical Control (4th Ed., Valentino & Goldenberg)
Solution Manual Linear State-Space Control Systems (Robert L. Williams, II & Douglas A. Lawrence)
Solution Manual Gas Turbine Theory (6th Ed., H.I.H. Saravanamuttoo, G.F.C. Rogers, H. Cohen & Paul Straznicky)
Solution Manual Rocket Propulsion Elements (7th Ed., George P. Sutton & Oscar Biblarz)
Solution Manual Rocket Propulsion Elements (8th Ed., George P. Sutton & Oscar Biblarz)
Solution Manual Orbital Mechanics for Engineering Students (1st Ed., Howard Curtis)
Solution Manual Orbital Mechanics for Engineering Students (2nd Ed., Howard Curtis)
Solution Manual Atmospheric and Space Flight Dynamics : Modeling and Simulation with MATLAB and Simulink (Ashish Tewari)
Solution Manual Flight Dynamics Principles (2nd Ed., by Cook)
Solution Manual Mechanics of Flight (1st Ed., Warren F. Phillips)
Solution Manual Mechanics of Flight (2nd Ed., Warren F. Phillips)
Solution Manual Modern Flight Dynamics (David K. Schmidt)
Solution Manual Fundamentals of Airplane Flight Mechanics (David G. Hull)
Solution Manual Dynamics of Flight : Stability and Control (3rd Ed., Bernard Etkin & Lloyd Duff Reid)
Solution Manual Aircraft Rescue and Firefighting (5th Ed., IFSTA)
Solution Manual Aircraft Propulsion (Saeed Farokhi)
Solution Manual Aircraft Performance (Maido Saarlas)
Solution Manual Design of Aircraft (Thomas C. Corke)
Solution Manual Flight Performance of Fixed and Rotary Wing Aircraft (Antonio Filippone)

Solution Manual Fundamentals Of Aircraft Structural Analysis (Howard Curtis)
Solution Manual Aircraft Control and Simulation (2nd Ed., Brian Stevens & Frank Lewis)
Solution Manual Aircraft Structures for Engineering Students (3rd Ed., T.H.G. Megson)
Solution Manual Aircraft Structures for Engineering Students (4th Ed., T.H.G. Megson)
Solution Manual Introduction to Aircraft Structural Analysis (T.H.G. Megson)
Solution Manual Mechanics of Aircraft Structures (2nd Ed, C. T. Sun)
Solution Manual Principles of Helicopter Aerodynamics (1st Ed., Leishman)
Solution Manual Fundamentals of Aerodynamics (2nd Ed., Anderson)
Solution Manual Fundamentals of Aerodynamics (3th Ed., Anderson)
Solution Manual Fundamentals of Aerodynamics (4th Ed., Anderson)
Solution Manual Fundamentals of Aerodynamics (5th Ed., Anderson)
Solution Manual Aerodynamics for Engineers (5th Ed., John Bertin & Russell Cummings)
Solution Manual Introduction to Flight (5th Ed., Anderson)
Solution Manual Introduction to Flight (6th Ed., Anderson)
Solution Manual Mechatronics : Principles and Applications (Godfrey Onwubolu)
Solution Manual Mechatronics (Sabri Cetinkunt)
Solution Manual Introduction to Mechatronic Design (J. Edward Carryer, Matthew Ohline & Thomas Kenny)
Solution Manual Introduction to Mechatronics and Measurement Systems (2nd Ed., David Alciatore & Michael Histand)
Solution Manual Introduction to Mechatronics and Measurement Systems (3rd Ed., David Alciatore & Michael Histand)
Solution Manual Introduction to Mechatronics and Measurement Systems (4th Ed., David Alciatore & Michael Histand)
Solution Manual Introduction to Engineering Experimentation (2nd Ed., Wheeler & Ganji)
Solution Manual Introduction to Engineering Experimentation (3rd Ed., Wheeler & Ganji)
Solution Manual Gas Dynamics (3rd Ed., John & Keith)
Solution Manual Fundamentals of Gas Dynamics (2nd Ed, Robert D. Zucker)
Solution Manual Theory of Ground Vehicles (3rd Ed., J. Y. Wong)
Solution Manual Theory of Ground Vehicles (4th Ed., J. Y. Wong)
Solution Manual Vehicle Dynamics : Theory and Application (Reza Jazar)
Solution Manual Internal Combustion Engines : Applied Thermosciences (2nd Ed., Ferguson & Kirkpatrick)
Solution Manual Advanced Engine Performance Diagnosis (4th Ed., James Halderman)
Solution Manual Automotive Engines (8th Ed., Crouse)
Solution Manual Automotive Heating & Air Conditioning (5th Ed., Tom Birch)
Solution Manual Diagnosis and Troubleshooting of Automotive

Electrical, Electronic, and Computer Systems (5th Ed., James Halderman)
Solution Manual Automotive Brake Systems Package (4th Ed., Rehkopf)
Solution Manual Automotive Brake Systems (4th Ed., Halderman)
Solution Manual Automotive Engine Performance (2nd Ed., Halderman)
Solution Manual Automotive Engines : Theory and Servicing (6th Ed., James Halderman)
Solution Manual Automotive Fuel and Emissions Control Systems (2nd Ed., James Halderman & James Linder)
Solution Manual Automotive Science and Mathematics (Allan Bonnick)
Solution Manual Automotive Mathematics (Jason Rouvel)
Solution Manual Automotive Service Management (Andrew Rezin)
Solution Manual Automotive Technology : Principles, Diagnosis, and Service (3rd Ed., Halderman)
Solution Manual Automotive Steering, Suspension, and Alignment (4th Ed., Halderman)
Solution Manual Automatic Transmissions & Transaxles (4th Ed., Tom Birch & Chuck Rockwood)
Solution Manual Hybrid and Alternative Fuel Vehicles (Halderman & Martin)
Solution Manual Manual Drivetrains and Axles (5th Ed., Birch & Rockwood)
Solution Manual Blueprint Reading for the Machine Trades (6th Ed., Schultz & Smith)
Solution Manual Modern Welding Technology (6th Ed., Cary & Helzer)
Solution Manual Tissue Engineering (Bernhard O. Palsson & Sangeeta N. Bhatia)
Solution Manual Tissue Engineering (Clemens van Blitterswijk, et al.)
Solution Manual Tissue Mechanics (Cowin, Doty)
Solution Manual Technology and Society (3rd Ed., Hjorth, Eichler, Khan & Morello)
Solution Manual BTEC First Engineering Curriculum Support Pack (Mike Tooley)
Solution Manual BTEC First Engineering (Mike Tooley)
Solution Manual Exploring Engineering : An Introduction to Engineering and Design (1st Ed., Philip Kosky, George Wise, Robert Balmer & William Keat)
Solution Manual Exploring Engineering : An Introduction to Engineering and Design (2nd Ed., Philip Kosky, Robert Balmer, William Keat & George Wise)
Solution Manual Engineering Science (5th Ed., W. Bolton)
Solution Manual Principles of Energy Conversion (2nd Ed., Archie W. Culp)
Solution Manual Fundamentals of Renewable Energy Processes (1st Ed., Aldo da Rosa)
Solution Manual Fundamentals of Renewable Energy Processes (2nd Ed., Aldo da Rosa)
Solution Manual Alternative Energy Systems (B. K. Hodge)
Solution Manual Solar Energy Engineering : Processes and Systems (Soteris Kalogirou)

Solution Manual Solar Engineering of Thermal Processes (2nd Ed., John Duffie & William Beckman)
Solution Manual Solar Engineering of Thermal Processes (3rd Ed., John Duffie & William Beckman)
Solution Manual Energy Technology and Directions for the Future (Fanchi)
Solution Manual Power Generation Technologies (Paul Breeze)
Solution Manual Concepts in Engineering (Holtzapple & Reece)
Solution Manual Concepts in Engineering (2nd Ed., Holtzapple & Reece)
Solution Manual Foundations of Engineering (2nd Ed, Holtzapple & Dan Reece)
Solution Manual Industrial Mechanics and Maintenance (3rd Ed., Larry Chastain)
Solution Manual Mechanical and Electrical Equipment for Buildings (10th Ed., Stein, Reynolds, Grondzik, Kwok)
Solution Manual Mechanical and Electrical Equipment for Buildings (11th Ed., Grondzik, Kwok, Stein & Reynolds)
Solution Manual Mechanical & Electrical Systems in Buildings (4th Ed., Richard Janis & William Tao)
Solution Manual Engineering Drawing And Design (7th Ed., Jensen, Helsel & Short)
Solution Manual Autodesk Inventor (James M. Leake)
Solution Manual Engineering Design Graphics : Sketching, Modeling, and Visualization (1st Ed., James Leake & Jacob Borgerson)
Solution Manual Orthopaedic Biomechanics : Mechanics and Design in Musculoskeletal Systems (Donald Bartel, Dwight Davy & Tony Keaveny)
Solution Manual Science for Engineering (3rd Ed., John Bird)

659. 4075 Solutions manual and Test Banks to Electrical, Electronics and Computer Engineering Books - part2

Newsgroup: rec.radio.amateur.antenna
Date: 2011-03-26 22:11:19 UTC
From: BERGH <mattosbw1@gmail.com>
Message-ID: <c3d753bb-57d3-4a8c-9549-7e5642f38c57@q40g2000prh.googlegroups.com>
Source record: 5310

List of Solutions Manuals and Test Banks

---

contact me to : mattosbw1@gmail.com
mattosbw1(at)gmail.com

NOTE : "THIS SERVICE IS NOT AVAILABLE FOR : CHINA, INDIA, RUSSIA, PAKISTAN, IRAQ, IRAN, PHILIPPINES, NORTH KOREA, NEPAL, BANGLADESH, SRI LANKA, MALDIVES, BHUTAN & COLOMBIA".

If your wanted solutions manual is not in this list, also can ask me if is available (it is a partial list). Then if you need solutions manual only contact me by email.

"ARE NOT AVAILABLES BOOKS IN DIGITAL FORMAT", ONLY SOLUTIONS MANUALS AND TEST BANKS.

This same "list of titles" of texts with availables solutions manual and/or test banks is for download from :

http://www.megaupload.com/?d=ADDS77XH

I do not review the forums, just send me an email.

- Electrical, Electronics & Computer Engineering :

Solution Manual Design for Electrical and Computer Engineers (J. Eric Salt & Robert Rothery)
Solution Manual Electrical Engineering : Principles and Applications (3rd Ed., Hambley)
Solution Manual Electrical Engineering : Principles and Applications (4th Ed., Hambley)
Solution Manual Electrical Engineering : Principles and Applications (5th Ed., Hambley)
Solution Manual Electronics (2nd Ed., Hambley)
Solution Manual Electronics and Communications for Scientists and Engineers (Martin Plonus)
Solution Manual Cryptography & Network Security (Behrouz A Forouzan)
Solution Manual Data Communications and Networking (3rd Ed., Behrouz A. Forouzan)
Solution Manual Data Communications and Networking (4th Ed., Behrouz A. Forouzan)
Solution Manual TCP/IP Protocol Suite (2nd Ed., Behrouz Forouzan)
Solution Manual TCP/IP Protocol Suite (3rd Ed., Behrouz Forouzan)
Solution Manual TCP/IP Protocol Suite (4th Ed., Behrouz Forouzan)

Solution Manual Local Area Networks (Behrouz A Forouzan)
Solution Manual Analog Integrated Circuits for Communication : Principles, Simulation and Design (2nd Ed., Donald Pederson & Kartikeya Mayaram)
Solution Manual Satellite Communications (2nd Ed, Pratt, Bostian, Allnutt)
Solution Manual Business Data Communications (Behrouz A Forouzan)
Solution Manual Logic and Computer Design Fundamentals (4th Ed., Mano & Kime)
Solution Manual Linear Robust Control (Michael Green, David J. N. Limebeer)
Solution Manual Adaptive Control (2nd Ed., Karl Johan Astrom, Bjorn Wittenmark)
Solution Manual Digital Control Engineering : Analysis and Design (M. Sami Fadali & Antonio Visioli)
Solution Manual Computer-Controlled Systems : Theory and Design (3rd Ed., Karl Johan Astrom & Bjorn Wittenmark)
Solution Manual Electric Circuits (7th Ed., Nilsson & Riedel)
Solution Manual Electric Circuits (8th Ed., Nilsson & Riedel)
Solution Manual Electric Circuits (9th Ed., Nilsson & Riedel)
Solution Manual Introductory Circuits for Electrical and Computer Engineering (James Nilsson, Susan Riedel)
Solution Manual Electromagnetic Noise and Quantum Optical Measurements (Hermann A. Haus)
Solution Manual Optical Fiber Communications (4th Ed., Gerd Keiser)
Solution Manual Electromagnetics (Branislav M. Notaros)
Solution Manual Electromagnetics for Engineers (Fawwaz T. Ulaby)
Solution Manual Fundamentals of Applied Electromagnetics (5th Ed., Fawwaz T. Ulaby)
Solution Manual Fundamentals of Applied Electromagnetics (6th Ed., Ulaby, Michielssen & Ravaioli)
Solution Manual Applied Electromagnetics : Early Transmission Lines Approach (Stuart Wentworth)
Solution Manual Fundamentals of Electromagnetics with Engineering Applications (Stuart Wentworth)
Solution Manual Electromagnetics for Engineers : With Applications to Digital Systems and Electromagnetic Interference (Clayton Paul)
Solution Manual MEMS & Microsystems : Design and Manufacture (1st Ed., Tai-Ran Hsu)
Solution Manual MEMS & Microsystems : Design, Manufacture, and Nanoscale Engineering (2nd Ed., Tai-Ran Hsu)
Solution Manual Probability and Statistics for Engineering and the Sciences (7th Ed., Jay L. DeVore)
Solution Manual Probability and Stochastic Processes : A Friendly Introduction for Electrical and Computer Engineers (2nd Ed., Roy Yates & David Goodman)
Solution Manual Process Systems Analysis and Control (3rd Ed. Donald Coughanowr, Steven LeBlanc)
Solution Manual Fuel Cell Engines (Matthew M. Mench)
Solution Manual Fuel Cell Fundamentals (1st Ed., Ryan O'Hayre, et. al)

Solution Manual Fuel Cell Fundamentals (2nd Ed., Ryan O'Hayre, Whitney Colella, Suk-Won Cha, Fritz Prinz)
Solution Manual Control Systems Engineering (4th Ed., Norman Nise)
Solution Manual Control Systems Engineering (5th Ed., Norman Nise)
Solution Manual Control Systems Engineering (6th Ed., Norman Nise)
Solution Manual Automatic Control Systems (8th Ed., Benjamin C. Kuo, Farid Golnaraghi)
Solution Manual Automatic Control Systems (9th Ed., Farid Golnaraghi, Benjamin C. Kuo)
Solution Manual Basic Electricity for Industry : Circuits and Machines - Canadian Edition (Doug Edgar)
Solution Manual Basic Engineering Circuit Analysis (8th Ed., Irwin & Nelms)
Solution Manual Basic Engineering Circuit Analysis (9th Ed., Irwin & Nelms)
Solution Manual Basic Engineering Circuit Analysis (10th Ed., Irwin & Nelms)
Solution Manual A Brief Introduction to Circuit Analysis (J. David Irwin)
Solution Manual Semiconductor Devices : Basic Principles (Jasprit Singh)
Solution Manual Semiconductor Device Fundamentals (Robert F. Pierret)
Solution Manual Advanced Semiconductor Fundamentals (2nd Ed., Robert F. Pierret)
Solution Manual Device Electronics for Integrated Circuits (3rd Ed., Richard S. Muller, Theodore I. Kamins)
Solution Manual Fundamentals of Semiconductor Devices (Anderson)
Solution Manual Scientific Computing (2nd Ed., Michael T. Heath)
Solution Manual Scientific Computing with Case Studies (Dianne P. O'Leary)
Solution Manual Pattern Recognition and Machine Learning (Christopher M. Bishop)
Solution Manual Modern Semiconductor Devices for Integrated Circuits (Chenming C. Hu)
Solution Manual Analysis and Design of Analog Integrated Circuits (4th Ed., Paul Gray, et al.)
Solution Manual Analysis and Design of Analog Integrated Circuits (5th Ed., Paul Gray)
Solution Manual Analysis and Design of Digital Integrated Circuits (3rd Ed., Hodges)
Solution Manual Introduction to Electric Circuits (6th Ed., Dorf & Svoboda)
Solution Manual Introduction to Electric Circuits (7th Ed., Dorf & Svoboda)
Solution Manual Introduction to Electric Circuits (8th Ed., Dorf & Svoboda)
Solution Manual Modulation, Detection and Coding (Tommy Öberg)
Solution Manual Principles of Communications: Systems, Modulation, and Noise (5th Ed., R.E. Ziemer & W.H. Tranter)
Solution Manual Principles of Communications (6th Ed., R.E. Ziemer &

W.H. Tranter)
Solution Manual The Analysis and Design of Linear Circuits (4th Ed, Thomas & Rosa)
Solution Manual The Analysis and Design of Linear Circuits : Laplace Early (4th Ed, Thomas & Rosa)
Solution Manual The Analysis and Design of Linear Circuits (5th Ed, Thomas)
Solution Manual The Analysis and Design of Linear Circuits (6th Ed, Thomas, Rosa & Toussaint)
Solution Manual Dynamic Modeling and Control of Engineering Systems (2nd Ed., J. Lowen Shearer, Bohdan Kulakowski, John Gardner)
Solution Manual Modern Control Systems (11th Ed., Dorf & Bishop)
Solution Manual Modern Control Systems (12th Ed., Dorf & Bishop)
Solution Manual System Dynamics (1st Ed., William Palm III)
Solution Manual System Dynamics (2nd Ed., William Palm III)
Solution Manual System Dynamics and Response (S. Graham Kelly)
Solution Manual System Dynamics for Engineering Students : Concepts and Applications (Nicolae Lobontiu)
Solution Manual Optimal Control (2nd Ed., Frank Lewis & Vassilis Syrmos)
Solution Manual Optimal Control Theory : An Introduction (Donald E. Kirk)
Solution Manual Power Electronics (1st Ed., Daniel W. Hart)
Solution Manual Power Electronic Circuits (Issa Batarseh)
Solution Manual Power Electronics : Circuits, Devices and Applications (3rd Ed., Muhammad H. Rashid)
Solution Manual Power Electronics : Converters, Applications, and Design (3rd Ed., Ned Mohan, Tore Undeland & William Robbins)
Solution Manual Intuitive Probability and Random Processes using MATLAB (Steven Kay)
Solution Manual Signals and Systems using MATLAB (Luis Chaparro)
Solution Manual Analog Signals and Systems (Erhan Kudeki & David C. Munson, Jr.)
Solution Manual Continuous and Discrete Time Signals and Systems (Mrinal Mandal, Amir Asif)
Solution Manual Digital Signal and Image Processing (Tamal Bose)
Solution Manual Digital Image Processing (2nd Ed., Rafael Gonzalez, Richard Woods)
Solution Manual A Wavelet Tour of Signal Processing : The Sparse Way (3rd Ed., Stephane Mallat)
Solution Manual Discrete-Time Signal Processing (2nd Ed., Alan Oppenheim, Ronald Schafer, John Buck)
Solution Manual Discrete-Time Signal Processing (3rd Ed., Alan Oppenheim & Ronald Schafer)
Solution Manual Signal Processing First (James H. McClellan, Ronald W. Schafer, Mark A. Yoder)
Solution Manual Statistical Digital Signal Processing and Modeling (Monson Hayes)
Solution Manual Digital Signal Processing (Thomas J. Cavicchi)
Solution Manual Digital Signal Processing System Design : LabVIEW-

Based Hybrid Programming (2nd Ed., Kehtarnavaz)
Solution Manual Digital Signal Processing (2nd Ed., Mitra)
Solution Manual Digital Signal Processing (3rd Ed., Mitra)
Solution Manual Digital Signal Processing (4th Ed., Mitra)
Solution Manual Digital Signal Processing (4th Ed., John G. Proakis, Dimitris K Manolakis)
Solution Manual Digital Signal Processing (Charles Schuler & Mahesh Chugani)
Solution Manual Digital Signal Processing : Fundamentals and Applications (Li Tan)
Solution Manual Digital Signal Processing : An Experimental Approach (Shlomo Engelberg)
Solution Manual Digital Signal Processing : System Analysis and Design (Paulo S. R. Diniz)
Solution Manual Digital Signal Processing : A Modern Introduction (Ashok Ambardar)
Solution Manual Engineering Optimization : Theory and Practice (4th Ed., Singiresu S. Rao)
Solution Manual Applied Optimization with MATLAB Programming (1st Ed., P. Venkataraman)
Solution Manual Applied Optimization with MATLAB Programming (2nd Ed., P. Venkataraman)
Solution Manual Introduction to Applied Optimization (2nd Ed., Urmila Diwekar)
Solution Manual Logic Synthesis and Verification Algorithms (Gary Hachtel & Fabio Somenzi)
Solution Manual Adaptive Filtering : Algorithms and Practical Implementation (3rd Ed., Paulo S. R. Diniz)
Solution Manual Introduction to Scientific Computation and Programming (Daniel T. kaplan)
Solution Manual Principles of Signal Detection and Parameter Estimation (Bernard C. Levy)
Solution Manual Electric Machines Analysis and Design Applying MatLab (Cathey)
Solution Manual Fundamentals of Electrical Engineering (Giorgio Rizzoni)
Solution Manual Principles and Applications of Electrical Engineering (4th Ed, Rizzoni)
Solution Manual Principles and Applications of Electrical Engineering (5th Ed, Rizzoni)
Solution Manual Fundamentals of Electric Circuits (2nd Ed., Alexander & Sadiku)
Solution Manual Fundamentals of Electric Circuits (3rd Ed., Alexander & Sadiku)
Solution Manual Fundamentals of Electric Circuits (4th Ed., Alexander & Sadiku)
Solution Manual MSP430 Microcontroller Basics (John Davies)
Solution Manual Programming Massively Parallel Processors : A Hands-on Approach (David Kirk & Wen-mei Hwu)
Solution Manual Embedded Systems and Software Validation (Abhik

Roychoudhury)
Solution Manual Embedded Systems Design with Platform FPGAs : Principles and Practices (Ronald Sass, Andrew Schmidt)
Solution Manual Embedded DSP Processor Design : Application Specific Instruction Set Processors (Dake Liu)
Solution Manual Embedded Microcontrollers and Processor Design (Charles Greg Osborn)
Solution Manual Embedded System Design : A Unified Hardware/Software Introduction (Vahid & Givargis)
Solution Manual Embedded Microcomputer Systems : Real Time Interfacing (2nd Ed., Jonathan W. Valvano)
Solution Manual Introduction to Programming with C++ (2nd Ed., Y. Daniel Liang)
Solution Manual Matlab : A Practical Introduction to Programming and Problem Solving (Stormy Attaway)
Solution Manual Principles of Computer System Design : An Introduction (Jerome Saltzer & M. Frans Kaashoek)
Solution Manual The Illustrated Network : How TCP/IP Works in a Modern Network (Walter Goralski)
Solution Manual Electronic Design Automation : Synthesis, Verification, and Test (Laung-Terng Wang, Yao-Wen Chang & Kwang-Ting Cheng)
Solution Manual Digital Design (Frank Vahid)
Solution Manual Digital Design with RTL Design, Verilog and VHDL (2nd Ed., Frank Vahid)
Solution Manual Digital Logic Design Principles (Balabanian & Carlson)
Solution Manual Fundamentals of Logic Design (5th Ed., Charles H. Roth)
Solution Manual Real-Time Systems and Software (Alan Shaw)
Solution Manual Introduction to VLSI Circuits and Systems (John P. Uyemura)
Solution Manual Chip Design for Submicron VLSI : CMOS Layout & Simulation (John Uyemura)
Solution Manual Classical Electrodynamics (2nd Ed., John David Jackson)
Solution Manual Objects, Abstraction, Data Structures and Design : Using C++ (Elliot B. Koffman & Paul A. T. Wolfgang)
Solution Manual Objects, Abstraction, Data Structures and Design Using Java Version 5.0 (Elliot B. Koffman & Paul A. T. Wolfgang)
Solution Manual Computer Architecture and Organization : An Integrated Approach (Murdocca & Heuring)
Solution Manual Wiley Pathways Networking Basics (1st Ed., Ciccarelli, Faulkner, FitzGerald, Dennis & Miller)
Solution Manual Software Engineering : Principles and Practice (3rd Ed., Hans van Vliet)
Solution Manual Software Design : From Programming to Architecture (Eric Braude)
Solution Manual Software Engineering : An Object-Oriented Perspective (Eric Braude)
Solution Manual Software Engineering : Modern Approaches (2nd Ed.,

Eric Braude & Michael Bernstein)
Solution Manual Neural and Adaptive Systems : Fundamentals through Simulations (José Principe, Neil Euliano & W. Curt Lefebvre)
Solution Manual Fundamentals of Electronic Circuit Design (David J. Comer & Donald T. Comer)
Solution Manual Microelectronic Circuit Design (2nd Ed., Jaeger & Blalock)
Solution Manual Microelectronic Circuit Design (3rd Ed., Jaeger & Blalock)
Solution Manual Microelectronic Circuit Design (4th Ed., Jaeger & Blalock)
Solution Manual Introduction to Microelectronic Fabrication : Volume 5 of Modular Series on Solid State Devices (2nd Ed., Richard Jaeger)
Solution Manual Microelectronic Circuits (5th Ed., Adel S. Sedra, K. C. Smith)
Solution Manual VHDL for Engineers (Kenneth Short)
Solution Manual Fundamentals of Digital Logic with VHDL Design (1st Ed., Brown & Vranesic)
Solution Manual Fundamentals of Digital Logic with VHDL Design (2nd Ed., Brown & Vranesic)
Solution Manual Fundamentals of Digital Logic with VHDL Design (3rd Ed., Brown & Vranesic)
Solution Manual CMOS Analog Circuit Design (2nd Ed., Phillip E. Allen, Douglas R. Holberg)
Solution Manual Design of Analog CMOS Integrated Circuits (Behzad Razavi)
Solution Manual Design of Integrated Circuits for Optical Communications (Behzad Razavi)
Solution Manual Fundamentals of Microelectronics, Preliminary Edition (Behzad Razavi)
Solution Manual Fundamentals of Microelectronics (1st Ed., Behzad Razavi)
Solution Manual Design with Operational Amplifiers and Analog Integrated Circuits (3rd Ed., Sergio Franco)
Solution Manual Your UNIX : The Ultimate Guide (1st Ed., Sumitabha Das)
Solution Manual Your UNIX : The Ultimate Guide (2nd Ed., Sumitabha Das)
Solution Manual Microwave Engineering (Annapurna Das)
Solution Manual Microwave Engineering (3rd Ed., David M. Pozar)
Solution Manual Microwave and RF Design of Wireless Systems (David M. Pozar)
Solution Manual Introduction to Wireless Systems (P. M. Shankar)
Solution Manual Microwave Transistor Amplifiers : Analysis and Design (2nd Ed., Guillermo Gonzalez)
Solution Manual Control Systems (Madan Gopal)
Solution Manual A First Lab in Circuits and Electronics (Yannis Tsividis)
Solution Manual Power System Analysis : Analysis and Design (John Grainger)

Solution Manual Power Systems Analysis (2nd Ed., Hadi Saadat)
Solution Manual Power Systems Analysis and Design (4th Ed., J.Duncan Glover and Mulukutla S. Sarma)
Solution Manual An Introduction to Digital and Analog Communications (2nd Ed., Simon Haykin & Michael Moher)
Solution Manual Communication Systems (4th Ed., Simon Haykin)
Solution Manual Communication Systems (5th Ed., Simon Haykin)
Solution Manual Communication Systems (4th Ed., A. Bruce Carlson, Paul B. Crilly, Janet Rutledge)
Solution Manual Communication Systems (5th Ed., A. Bruce Carlson, Paul B. Crilly)
Solution Manual Signals and Systems (2nd Ed., Simon Haykin & Barry Van Veen)
Solution Manual Introduction to Computing Systems : From bits & gates to C & beyond (1st Ed., Patt and Patel)
Solution Manual Introduction to Computing Systems : From bits & gates to C & beyond (2nd Ed., Patt and Patel)
Solution Manual Elements of the Theory of Computation (2nd Ed., Lewis & Papadimitriou)
Solution Manual Introduction to Languages and the Theory of Computation (3rd Ed., John Martin)
Solution Manual Introduction to Languages and the Theory of Computation (4th Ed., John Martin)
Solution Manual Mechanical & Electrical Systems in Buildings (4th Ed., Richard Janis & William Tao)
Solution Manual Silicon VLSI Technology : Fundamentals, Practice, and Modeling (Plummer, Deal & Griffin)
Solution Manual Dynamic Electromagnetics (Paul Diament)
Solution Manual Engineering Electromagnetics (2nd Ed., Nathan Ida)
Solution Manual Engineering Electromagnetics (Kenneth Demarest)
Solution Manual Field and Wave Electromagnetics (1st Ed., David Cheng)
Solution Manual Fundamentals of Engineering Electromagnetics (David Cheng)
Solution Manual Information Modeling and Relational Databases (2nd Ed., Terry Halpin & Tony Morgan)
Solution Manual Probability, Statistics, and Random Processes For Electrical Engineering (3rd Ed., Alberto Leon-Garcia)
Solution Manual Detection and Estimation Theory (Thomas Schonhoff & Arthur Giordano)
Solution Manual The Intel Microprocessors (8th Ed., Barry B. Brey)
Solution Manual Wireless Networking (Kumar, Manjunath & Kuri)
Solution Manual Wireless Communications : Principles and Practice (2nd Ed., Theodore S. Rappaport)
Solution Manual Digital Electronics and Design with VHDL (Volnei A. Pedroni)
Solution Manual System-on-Chip Test Architectures : Nanometer Design for Testability (Wang, Stroud & Touba)
Solution Manual Digital Design (Verilog) : An Embedded Systems Approach Using Verilog (Peter Ashenden)
Solution Manual Digital Design (VHDL) : An Embedded Systems Approach

Using VHDL (Peter Ashenden)
Solution Manual Computer Organization and Design : The Hardware/ Software Interface (3rd Ed., Patterson & Hennessy)
Solution Manual Computer Organization and Design : The Hardware/ Software Interface (4th Ed., Patterson & Hennessy)
Solution Manual Fundamentals of Computer Organization and Design (Sivarama P. Dandamudi)
Solution Manual Wireless Communications & Networking (Vijay Garg)
Solution Manual Network Flows : Theory, Algorithms, and Applications (Ravindra K. Ahuja, Thomas L. Magnanti, James B. Orlin)
Solution Manual Network Analysis, Architecture, and Design (3rd Ed., James McCabe)
Solution Manual Computer Networks : A Systems Approach (4th Ed., Peterson & Davie)
Solution Manual Computer Networks ISE : A Systems Approach (4th Ed., Peterson & Davie)
Solution Manual Digital Design and Computer Architecture (David Harris & Sarah Harris)
Solution Manual Fault-Tolerant Systems (Israel Koren & C. Krishna)
Solution Manual Computer Architecture : Pipelined and Parallel Processor Design (Michael J. Flynn)
Solution Manual Computer Architecture : A Quantitative Approach (4th Ed., Hennessy & Patterson)
Solution Manual High-Performance Embedded Computing : Architectures, Applications, and Methodologies (Wayne Wolf)
Solution Manual Pattern Recognition (3rd Ed., Theodoridis & Koutroumbas)
Solution Manual Pattern Recognition (4th Ed., Theodoridis & Koutroumbas)
Solution Manual Data Mining : Concepts and Techniques (2nd Ed., Han & Kamber)
Solution Manual Commonsense Reasoning (Erik Mueller)
Solution Manual Introduction to Data Compression (3rd Ed., Khalid Sayood)
Solution Manual Programming Language Pragmatics (2nd Ed., Michael Scott)
Solution Manual Programming Language Pragmatics (3rd Ed., Michael Scott)
Solution Manual Computer Graphics for Java Programmers (2nd Ed., Leen Ammeraal & Kang Zhang)
Solution Manual Database Modeling and Design : Logical Design (4th Ed., Teorey, Lightstone & Nadeau)
Solution Manual Computers As Components : Principles of Embedded Computing System Design (1st Ed., Wayne Wolf)
Solution Manual Computers As Components : Principles of Embedded Computing System Design (2nd Ed., Wayne Wolf)
Solution Manual Virtual Machines : Versatile Platforms for Systems and Processes (Jim Smith & Ravi Nair)
Solution Manual Comprehensive Functional Verification : The Complete Industry Cycle (Wile, Goss & Roesner)

Solution Manual User Interface Design and Evaluation (Stone, Jarrett, Woodroffe & Minocha)
Solution Manual Network Algorithmics : An Interdisciplinary Approach to Designing Fast Networked Devices (George Varghese)
Solution Manual Data Modeling Essentials (3rd Ed., Simsion & Witt)
Solution Manual A Student Guide to Object-Oriented Development (Carol Britton & Jill Doake)
Solution Manual Routing, Flow, and Capacity Design in Communication and Computer Networks (Pioro & Medhi)
Solution Manual Knowledge Representation and Reasoning (Brachman & Levesque)
Solution Manual Communication Networking : An Analytical Approach (Anurag Kumar, D. Manjunath & Joy Kuri)
Solution Manual Principles and Practices of Interconnection Networks (Dally & Towles)
Solution Manual Game Physics (David Eberly)
Solution Manual Engineering a Compiler (Keith Cooper & Linda Torczon)
Solution Manual Constraint Processing (Rina Dechter)
Solution Manual Design Methods for Reactive Systems : Yourdon, Statemate, and the UML (R. J. Wieringa)
Solution Manual Temporal Data & the Relational Model (C.J. Date, Darwen & Lorentzos)
Solution Manual Java Made Simple (2nd Ed., P. K. McBride)
Solution Manual The Firmware Handbook (Jack Ganssle)
Solution Manual Optical Networks : A Practical Perspective (2nd Ed., Ramaswami & Sivarajan)
Solution Manual Optical Networks : A Practical Perspective (3rd Ed., Ramaswami, Sivarajan & Sasaki)
Solution Manual Usability Engineering : Scenario-Based Development of Human-Computer Interaction (Rosson & Carroll)
Solution Manual The Designer's Guide to VHDL (2nd Ed., Peter Ashenden)
Solution Manual Transactional Information Systems : Theory, Algorithms, and the Practice of Concurrency Control and Recovery (Weikum & Vossen)
Solution Manual Parallel Computer Architecture : A Hardware/Software Approach (Culler, Singh & Gupta)
Solution Manual Advanced Compiler Design and Implementation (Steven Muchnick)
Solution Manual Parallel Programming with MPI (Peter Pacheco)
Solution Manual Distributed Algorithms (Nancy Lynch)
Solution Manual Electrical and Electronic : Principles and Technology (3rd Ed., John Bird)
Solution Manual Electrical and Electronic : Principles and Technology (4th Ed., John Bird)
Solution Manual Electrical Circuit Theory and Technology (3rd Ed., John Bird)
Solution Manual Electrical Circuit Theory and Technology (4th Ed., John Bird)
Solution Manual Electronic Circuits : Fundamentals & Applications (3rd Ed., Mike Tooley)

Solution Manual A Practical Guide to SysML : The Systems Modeling Language (Friedenthal, Moore & Steiner)
Solution Manual Multidimensional Signal, Image, and Video Processing and Coding (John Woods)
Solution Manual Bioelectrical Signal Processing in Cardiac and Neurological Applications (Leif Sörnmo & Pablo Laguna)
Solution Manual Foundations of Analog and Digital Electronic Circuits (Anant Agarwal & Jeffrey Lang)
Solution Manual Introduction to Linear Circuit Analysis and Modelling : From DC to RF (Luis Moura & Izzat Darwazeh)
Solution Manual Embedded Systems Architecture : A Comprehensive Guide for Engineers and Programmers (Tammy Noergaard)
Solution Manual Bioimpedance and Bioelectricity Basics (2nd Ed., Grimnes & Martinsen)
Solution Manual Simulation with Arena (5th Ed., Kelton, Sadowski & Swets)
Solution Manual Simulation Modeling and Analysis with ARENA (Tayfur Altiok & Benjamin Melamed)
Solution Manual The Visual Story : Creating the Visual Structure of Film, TV and Digital Media (2nd Ed., Bruce Block)
Solution Manual The Shut Up and Shoot Documentary Guide : A Down & Dirty DV Production (Anthony Artis)
Solution Manual Portable Video : ENG & EFP (5th Ed., Medoff & Fink)
Solution Manual Voice and Vision : A Creative Approach to Narrative Film and DV Production (Mick Hurbis-Cherrier)
Solution Manual Writing for Multimedia and the Web : A Practical Guide to Content Development for Interactive Media (3rd Ed., Timothy Garrand)
Solution Manual Developing and Maintaining a Design-Tech Portfolio : A Guide for Theatre, Film & TV (Rafael Jaen)
Solution Manual Producing for TV and Video : A Real-World Approach (Cathrine Kellison)
Solution Manual Producing for TV and New Media : A Real-World Approach for Producers (2nd Ed., Cathrine Kellison)
Solution Manual Placing Shadows : Lighting Techniques for Video Production (3rd Ed., Gloman & Tom LeTourneau)
Solution Manual Film Directing Fundamentals : See Your Film Before Shooting (3rd Ed., Nicholas Proferes)
Solution Manual Introduction to Media Production : The Path to Digital Media Production (3rd Ed., Musburger & Kindem)
Solution Manual Introduction to Media Production : The Path to Digital Media Production (4th Ed., Kindem & Musburger)
Solution Manual Directing the Documentary (5th Ed., Michael Rabiger)
Solution Manual Video Production Handbook (4th Ed., Gerald Millerson & Jim Owens)
Solution Manual Making Media : Foundations of Sound and Image Production (Jan Roberts-Breslin)
Solution Manual Prepare to Board! Creating Story and Characters for Animation Features and Shorts (Nancy Beiman)
Solution Manual Light and Lens : Photography in the Digital Age

(Robert Hirsch)
Solution Manual The Radio Station : Broadcast, Satellite & Internet (7th Ed., Michael Keith)
Solution Manual Developing Story Ideas (2nd Ed., Michael Rabiger)
Solution Manual Radio Production Worktext : Studio and Equipment (5th Ed., Reese, Gross & Gross)
Solution Manual Broadcast News Writing, Reporting, and Producing (4th Ed., Ted White)
Solution Manual Problem Solving and Programming Concepts (7th Ed., Sprankle)
Solution Manual Problem Solving and Programming Concepts (8th Ed., Sprankle & Hubbard)
Solution Manual A Balanced Introduction to Computer Science (2nd Ed., David Reed)
Solution Manual Introduction to Computing and Programming with Java : A Multimedia Approach (Guzdial & Ericson)
Solution Manual Starting Out with Programming Logic and Design (Tony Gaddis)
Solution Manual Starting Out with Programming Logic and Design (2nd Ed., Tony Gaddis)
Solution Manual Tools For Structured and Object-Oriented Design (7th Ed., Bohl & Rynn)
Solution Manual Programming with Alice and Java (Lewis & DePasquale)
Solution Manual e-Business and e-Commerce How to Program (Harvey M. Deitel, Paul J. Deitel, Tem R. Nieto)
Solution Manual XML How to Program (Harvey M. Deitel, Paul J. Deitel, Tem R. Nieto, Ted Lin, Praveen Sadhu)
Solution Manual Python How to Program (Harvey M. Deitel, Paul J. Deitel, Jonathan P. Liperi Ben Wiedermann)
Solution Manual Perl How to Program (Harvey M. Deitel, Paul J. Deitel, Tem R. Nieto, D. C. McPhie)
Solution Manual C How to Program (4th Ed., Harvey & Paul Deitel)
Solution Manual C How to Program (5th Ed., Harvey & Paul Deitel)
Solution Manual C++ How to Program (6th Ed., Harvey & Paul Deitel)
Solution Manual Visual Basic.NET How to Program (2nd Ed., Harvey M. Deitel, Paul J. Deitel, Tem R. Nieto)
Solution Manual Visual C++ 2008 How to Program (2nd Ed., Harvey & Paul Deitel)
Solution Manual Internet & World Wide Web : How to Program (4th Ed., Harvey & Paul Deitel)
Solution Manual Web Technologies : A Computer Science Perspective (Jeffrey C. Jackson)
Solution Manual Mastering the Internet, XHTML and JavaScript (2nd Ed., Ibrahim Zeid)
Solution Manual Weaving a Website : Programming in HTML, Java Script, Perl and Java (Susan Anderson-Freed)
Solution Manual Simply C++ : An Application-Driven Tutorial Approach (Harvey & Paul Deitel)
Solution Manual Visual C# 2005 How to Program (2nd Ed., Harvey & Paul Deitel)

Solution Manual Visual C# 2008 How to Program (3rd Ed., Harvey & Paul Deitel)
Solution Manual Visual C# 2010 How to Program (4th Ed., Harvey & Paul Deitel)
Solution Manual Simply C# : An Application-Driven Tutorial Approach (Harvey & Paul Deitel, Hoey & Yaeger)
Solution Manual Java : An Introduction to Problem Solving and Programming (4th Ed., Walter Savitch)
Solution Manual Java : An Introduction to Problem Solving and Programming (5th Ed., Savitch & Carrano)
Solution Manual Introduction to Computing and Programming with Java : A Multimedia Approach (Guzdial & Ericson)
Solution Manual Java How to Program (7th Ed., Harvey & Paul Deitel)
Solution Manual Java For Students (5th Ed., Bell & Parr)
Solution Manual Java, Java, Java, Object-Oriented Problem Solving (3rd Ed., Morelli & Walde)
Solution Manual Java : An Eventful Approach (Bruce, Danyluk & Murtagh)
Solution Manual Introduction to Java Programming with JBuilder (3rd Ed., Y. Daniel Liang)
Solution Manual Starting Out with Visual Basic 2008 (4th Ed., Gaddis & Irvine)
Solution Manual Starting Out with Visual Basic 2010 (5th Ed., Gaddis & Irvine)
Solution Manual Starting Out with Python (Tony Gaddis)
Solution Manual Object-Oriented Programming in Python (Goldwasser & Letscher)
Solution Manual Introduction to MathCAD 11 (Ronald W. Larsen)
Solution Manual Introduction to MathCAD 13 (2nd Ed., Ronald W. Larsen)
Solution Manual MatLAB Programming (David Kuncicky)
Solution Manual Introduction to Maple 8 (David Schwartz)
Solution Manual Introduction to FORTRAN 90 (2nd Ed., Larry R. Nyhoff & Sanford Leestma)
Solution Manual Fortran 95/2003 Scientists and Engineers (3rd Ed., Stephen J. Chapman)
Solution Manual Introduction to Java (Stephen J. Chapman)
Solution Manual Java Software Solutions for AP Computer Science A (2nd Ed., Lewis, Loftus & Cocking)
Solution Manual Business Data Networks and Telecommunications (6th Ed., Raymond R. Panko)
Solution Manual Business Data Networks and Telecommunications (7th Ed., Raymond R. Panko)
Solution Manual Business Data Communications (Allen Dooley)
Solution Manual Object-Oriented Programming in C++ (4th Ed., Robert Lafore)
Solution Manual C++ : Classes and Data Structures (Jeffrey Childs)
Solution Manual Data Structures Outside-In with Java (Sesh Venugopal)
Solution Manual Data Structures and Abstractions with Java (2nd Ed., Frank M. Carrano)
Solution Manual Data Structures and Algorithms in Java (Peter Drake)
Solution Manual Practical Introduction to Data Structures and

Algorithm Analysis : C++ Edition (2nd Ed., Clifford A. Shaffer)
Solution Manual Computer Vision : A Modern Approach (David Forsyth & Jean Ponce)
Solution Manual Computer Graphics Using Java 2D and 3D (Hong Zhang & Y. Daniel Liang)
Solution Manual Computer Graphics Using OpenGL (3rd Ed., Francis Hill Jr. & Stephen Kelley)
Solution Manual Computer Graphics with OpenGL (3rd Ed., Donald Hearn & M. Pauline Baker)
Solution Manual User-Centered Web Site Development : A Human-Computer Interaction Approach (McCracken & Wolfe)
Solution Manual Fundamentals of Game Design (Ernest Adams & Andrew Rollings)
Solution Manual Introduction to The Game Industry (Moore & Sward)
Solution Manual Fundamentals of Math and Physics for Game Programmers (Wendy Stahler)
Solution Manual Usability Engineering : Process, Products & Examples (Laura Leventhal & Julie Barnes)
Solution Manual Web Usability : A User-Centered Design Approach (Jonathan Lazar)
Solution Manual Structured Computer Organization (5th Ed., Andrew S. Tanenbaum)
Solution Manual Assembly Language for Intel-Based Computers (5th Ed., Kip Irvine)
Solution Manual Assembly Language for x86 Processors (6th Ed., Kip R. Irvine)
Solution Manual Fundamentals of Multimedia (Ze-Nian Li & Mark Drew)
Solution Manual Digital Media Primer (Yue-Ling Wong)
Solution Manual Essentials for Design Macromedia Director MX 2004 Comprehensive (Tara Gray)
Solution Manual Modern Systems Analysis and Design (4th Ed., Jeffrey Hoffer, Joey George, & Joseph Valacich)
Solution Manual Modern Systems Analysis and Design (5th Ed., Jeffrey Hoffer, Joey George, & Joseph Valacich)
Solution Manual Modern Database Management (8th Ed., Hoffer, Prescott & Topi)
Solution Manual Modern Database Management (9th Ed., Hoffer, Prescott & Topi)
Solution Manual Database Systems Using Oracle (2nd Ed., Nilesh Shah)
Solution Manual An Advanced Course in Database Systems : Beyond Relational Databases (Dietrich & Urban)
Solution Manual Data and Text Mining : A Business Applications Approach (Thomas Miller)
Solution Manual Network Management : Concepts and Practice, A Hands-On Approach (J. Richard Burke)
Solution Manual Computer and Communication Networks (Nader F. Mir)
Solution Manual High Performance TCP/IP Networking (Mahbub Hassan & Raj Jain)
Solution Manual Computer Security : Principles and Practice (William Stallings & Lawrie Brown)

Solution Manual Computer Forensics : Principles and Practices (Volonino, Anzaldua & Godwin)
Solution Manual Disaster Recovery : Principles and Practices (April Wells, Charlyne Walker & Timothy Walker)
Solution Manual Firewalls and VPNs : Principles and Practices (Richard Tibbs & Edward Oakes)
Solution Manual Network Defense and Countermeasures : Principles and Practices (Chuck Easttom)
Solution Manual Corporate Computer and Network Security (1st Ed., Raymond Panko)
Solution Manual Corporate Computer and Network Security (2nd Ed., Raymond Panko)
Solution Manual IP Telephony Using CallManager Express Lab Portfolio (Cheryl Schmidt & Ernie Friend)
Solution Manual High-Speed Networks and Internets : Performance and Quality of Service (2nd Ed., William Stallings)
Solution Manual Object-Oriented Modeling and Design with UML (2nd Ed., Michael Blaha & James Rumbaugh)
Solution Manual Operating Systems : Internals and Design Principles (5th Ed., William Stallings)
Solution Manual Operating Systems : Internals and Design Principles (6th Ed., William Stallings)
Solution Manual Distributed Systems : Principles and Paradigms (2nd Ed., Tanenbaum & Van Steen)
Solution Manual Modern Operating Systems (3rd Ed., Andrew Tanenbaum)
Solution Manual Computer Networks (4th Ed., Andrew S. Tanenbaum)
Solution Manual Computer Networks (5th Ed., Andrew S. Tanenbaum, David J. Wetherall)
Solution Manual Operating Systems Design and Implementation (3rd Ed., Andrew Tanenbaum & Albert Woodhull)
Solution Manual UNIX Unbounded : A Beginning Approach (5th Ed., Amir Afzal)
Solution Manual Introduction to Operating Systems and Networks (Ruth Watson)
Solution Manual Operating Systems (3rd Ed., Harvey Deitel, Paul Deitel & David Choffnes)
Solution Manual Operating Systems Principles (Lubomir Bic & Alan Shaw)
Solution Manual A Practical Guide to Linux : Commands, Editors, and Shell Programming (Mark Sobell)
Solution Manual A Practical Guide to Red Hat Linux : Fedora Core and Red Hat Enterprise Linux (2nd Ed., Mark Sobell)
Solution Manual A Practical Guide to Red Hat Linux : Fedora Core and Red Hat Enterprise Linux (3rd Ed., Mark Sobell)
Solution Manual A Practical Guide to Fedora and Red Hat Enterprise Linux: College Edition (Mark Sobell)
Solution Manual A Practical Guide to Ubuntu Linux (Mark Sobell)
Solution Manual Automata, Computability and Complexity : Theory and Applications (Elaine Rich)
Solution Manual Modern Digital Electronics (R.P. Jain)
Solution Manual Linear Systems and Signals (B.P. Lathi)

Solution Manual Modern Digital and Analog Communications Systems (3rd Ed., B. P. Lathi)
Solution Manual Introduction to Digital Systems (Milo D. Ercegovac, Lang & Moreno)
Solution Manual Embedded Systems : Architechture, Programming and Design (Raj Kamal)
Solution Manual Modern Power System Analysis (D. P. Kothari & I. J. Nagrath)
Solution Manual Basic Electrical Engineering (2nd Ed., D.P. Kothari, I.J. Nagrath)
Solution Manual Electric Machines (3rd Ed., D.P. Kothari, I.J. Nagrath)
Solution Manual Circuits and Networks (A. Sudhakar & S. Palli Shyammohan)
Solution Manual Electrical and Electronic Technology (9th Ed., Edward Hughes, John Hiley, Keith Brown & Ian McKenzie-Smith)
Solution Manual Electrical and Electronic Technology (10th Ed., Edward Hughes, John Hiley, Keith Brown & Ian McKenzie-Smith)
Solution Manual Electric Motors and Drives : Fundamentals, Types and Applications (3rd Ed., Austin Hughes)
Solution Manual Modern Processor Design : Fundamentals of Superscalar Processors (John P. Shen)
Solution Manual Computer Networks : Principles, Technologies and Protocols for Network Design (N. Olifer & V. Olifer)
Solution Manual Computer Networking : Internet Protocols in Action (Jeanna Matthews)
Solution Manual Computer Organization (5th Ed., Hamacher et al.)
Solution Manual CMOS Digital Integrated Circuits : Analysis and Design (3rd Ed., Sung-Mo Kang & Yusuf Leblebici)
Solution Manual Introduction to Logic Design (1st Ed., Alan B Marcovitz)
Solution Manual Introduction to Logic Design (2nd Ed., Alan B Marcovitz)
Solution Manual Introduction to Logic Design (3rd Ed., Alan B Marcovitz)
Solution Manual Introduction to Logic and Computer Design (Alan B Marcovitz)
Solution Manual Digital Principles and Design (Donald D. Givone)
Solution Manual Programmable Logic Controllers (3rd Ed., Frank Petruzella)
Solution Manual Programmable Logic Controllers (4th Ed., Frank Petruzella)

List of Solutions Manuals and Test Banks

---

contact me to : mattosbw1@gmail.com
mattosbw1(at)gmail.com

NOTE : "THIS SERVICE IS NOT AVAILABLE FOR : CHINA, INDIA, RUSSIA, PAKISTAN, IRAQ, IRAN, PHILIPPINES, NORTH KOREA, NEPAL, BANGLADESH, SRI LANKA, MALDIVES, BHUTAN & COLOMBIA".

If your wanted solutions manual is not in this list, also can ask me if is available (it is a partial list). Then if you need solutions manual only contact me by email.

"ARE NOT AVAILABLES BOOKS IN DIGITAL FORMAT", ONLY SOLUTIONS MANUALS AND TEST BANKS.

This same "list of titles" of texts with availables solutions manual and/or test banks is for download from :

http://www.megaupload.com/?d=ADDS77XH

I do not review the forums, just send me an email.

- Math, Statistics & Probability :

Solution manual Advanced Engineering Mathematics (8th Ed., Erwin Kreyszig)
Solution manual Advanced Engineering Mathematics (9th Ed., Erwin Kreyszig)
Solution manual Advanced Engineering Mathematics (10th Ed., Erwin Kreyszig)
Solution manual Advanced Engineering Mathematics (2nd Ed, Michael Greenberg)
Solution manual Advanced Engineering Mathematics (6th Ed., Peter O'Neil)
Solution manual Advanced Modern Engineering Mathematics (3rd Ed., Glyn James)
Solution manual Modern Engineering Mathematics (4th Ed., Glyn James)
Solution manual Differential Equations and Dynamical Systems (3rd Ed., Lawrence Perko)
Solution manual Introductory Differential Equations with Boundary Value Problems (3rd Ed., Martha Abell & James Braselton)
Solution manual A Modern Introduction to Differential Equations (2nd Ed., Henry J. Ricardo)

Solution manual Elementary Differential Equations (7th Ed., Boyce)
Solution manual Elementary Differential Equations (8th Ed., Boyce & Diprima)
Solution manual Elementary Differential Equations (9th Ed., Boyce & Diprima)
Solution manual Elementary Differential Equations and Boundary Value Problems (7th Ed., Boyce & Diprima)
Solution manual Elementary Differential Equations and Boundary Value Problems (8th Ed., Boyce & Diprima)
Solution manual Elementary Differential Equations and Boundary Value Problems (9th Ed., Boyce & Diprima)
Solution manual Differential Equations : An Introduction to Modern Methods and Applications (James Brannan & William Boyce)
Solution manual Differential Equations with Boundary Value Problems : An Introduction to Modern Methods and Applications (James Brannan & William Boyce)
Solution manual Advanced Calculus : A Transition to Analysis (Thomas Dence & Joseph Dence)
Solution manual Calculus : Early Transcendentals Combined (8th Ed., Anton, Bivens & Davis)
Solution manual Calculus : Early Transcendentals Combined (9th Ed., Anton, Bivens & Davis)
Solution manual Calculus : Multivariable (8th Ed., Anton, Bivens & Davis)
Solution manual Calculus : Multivariable (9th Ed., Anton, Bivens & Davis)
Solution manual Calculus : Early Transcendentals Single Variable (8th Ed., Anton, Bivens & Davis)
Solution manual Calculus : Early Transcendentals Single Variable (9th Ed., Anton, Bivens & Davis)
Solution manual Calculus : Late Transcendentals Combined (8th Ed., Anton, Bivens & Davis)
Solution manual Calculus : Late Transcendentals Combined (9th Ed., Anton, Bivens & Davis)
Solution manual Calculus : Late Transcendentals Single Variable (8th Ed., Anton, Bivens & Davis)
Solution manual Calculus : Late Transcendentals Single Variable (9th Ed., Anton, Bivens & Davis)
Solution manual Introduction to the Finite Element Method : Theory, Programming and Applications (Erik G. Thompson)
Solution manual A Physicist's Guide to Mathematica (2nd Ed., Patrick Tam)
Solution manual Mathematics for Engineers : A Modern Interactive Approach (3rd., Anthony Croft & Robert Davison)
Solution manual Measurement and Data Analysis for Engineering and Science (Patrick F Dunn)
Solution manual Elementary Linear Algebra (4th Ed., Stephen Andrilli & David Hecker)
Solution manual Elementary Linear Algebra Edition Abridged (9th Ed., Anton & Rorres)

Solution manual Elementary Linear Algebra (9th Ed., Anton)
Solution manual Elementary Linear Algebra with Applications (9th Ed., Anton & Rorres)
Solution manual Boundary Value Problems and Partial Differential Equations (6th Ed., David Powers)
Solution manual Introductory Statistics : Using Technology (5th Ed., Prem S. Mann)
Solution manual Introductory Statistics (6th Ed., Prem S. Mann)
Solution manual Introductory Statistics (7th Ed., Prem S. Mann)
Solution manual Basic Real Analysis (Houshang H. Sohrab)
Solution manual Modern Algebra : An Introduction (6th Ed., John Durbin)
Solution manual The Art and Craft of Problem Solving (2nd Ed., Paul Zeitz)
Solution manual Numerical Linear Algebra (Grégoire Allaire, Sidi Mahmoud Kaber, K. Trabelsi)
Solution manual Introductory Statistics for the Behavioral Sciences (6th Ed., Welkowitz, Cohen & Ewen)
Solution manual Statistics : Principles and Methods (5th Ed., Richard Johnson)
Solution manual Statistics : Principles and Methods (6th Ed., Richard Johnson)
Solution manual Statistical Bioinformatics : with R (Sunil K. Mathur)
Solution manual Parameter Estimation and Inverse Problems (Richard Aster, Brian Borchers & Clifford Thurber)
Solution manual Codes : An Introduction to Information Communication and Cryptography (Norman L. Biggs)
Solution manual Geometry and Its Applications (2nd Ed., Walter A. Meyer)
Solution manual Elementary Differential Geometry (2nd Ed., A.N. Pressley)
Solution manual Fractal Geometry : Mathematical Foundations and Applications (2nd Ed., Kenneth Falconer)
Solution manual Analytical and Computational Methods of Advanced Engineering Mathematics (Grant B. Gustafson & Calvin H. Wilcox)
Solution manual How to Read and Do Proofs : An Introduction to Mathematical Thought Processes (4th Ed., Daniel Solow)
Solution manual How to Read and Do Proofs : An Introduction to Mathematical Thought Processes (5th Ed., Daniel Solow)
Solution manual A Probability Path (Sidney Resnick)
Solution manual Intuitive Probability and Random Processes using MATLAB (Steven Kay)
Solution manual Modeling Random Processes for Engineers and Managers (James Solberg)
Solution manual Probability and Random Processes with Applications to Signal Processing (3rd Ed., Henry Stark & John W. Woods)
Solution manual Probability, Statistics, and Random Processes For Electrical Engineering (3rd Ed., Alberto Leon-Garcia)
Solution manual Probability Concepts in Engineering : Emphasis on Applications to Civil and Environmental Engineering (2nd Ed., Ang &

Tang)
Solution manual Applied Statistics for Engineers and Physical Scientists (3rd Ed., Johannes Ledolter & Robert Hogg)
Solution manual Applied Statistics and Probability for Engineers (3rd Ed., Montgomery & Runger)
Solution manual Applied Statistics and Probability for Engineers (4th Ed., Montgomery & Runger)
Solution manual Applied Statistics and Probability for Engineers (5th Ed., Montgomery & Runger)
Solution manual Engineering Statistics (3rd Ed., Montgomery, Runger & Hubele)
Solution manual Engineering Statistics (4th Ed., Montgomery, Runger & Hubele)
Solution manual Engineering Statistics (5th Ed., Montgomery, Runger & Hubele)
Solution manual Introduction to Statistical Quality Control (5th Ed., Montgomery)
Solution manual Introduction to Statistical Quality Control (6th Ed., Montgomery)
Solution manual Calculus : One Variables (10th Ed., Salas, Hille, Etgen)
Solution manual Calculus : One and Several Variables (8th Ed., Salas, Hille, Etgen)
Solution manual Calculus : One and Several Variables (10th Ed., Salas, Hille, Etgen)
Solution manual Squaring the Circle : Geometry in Art and Architecture (Paul Calter)
Solution manual Technical Mathematics (5th Ed., Paul Calter & Michael Calter)
Solution manual Technical Mathematics with Calculus (5th Ed., Paul Calter & Michael Calter)
Solution manual Technical Mathematics with Calculus, Canadian Edition (Paul Calter & Michael Calter)
Solution manual Techniques of Problem Solving (Luis Fernández, Haedeh Gooransarab)
Solution manual Probability and Statistics in Engineering (4th Ed., Hines, Montgomery, Goldsman & Borror)
Solution manual A First Course in Design and Analysis of Experiments (Gary W. Oehlert)
Solution manual Design and Analysis of Experiments (6th Ed., Douglas Montgomery)
Solution manual Design and Analysis of Experiments (7th Ed., Douglas Montgomery)
Solution manual Introduction to Engineering Experimentation (2nd Ed., Wheeler & Ganji)
Solution manual Introduction to Engineering Experimentation (3rd Ed., Wheeler & Ganji)
Solution manual Introduction to the Design & Analysis of Experiments (Canavos & Koutrouvelis)
Solution manual Modern Methods For Quality Control and Improvement

(2nd Ed., Wadsworth, Stephens, Godfrey)
Solution manual Essential Statistics for Economics, Business and Management (Teresa Bradley)
Solution manual Statistics and Econometrics : Methods and Applications (Ashenfelter, Levine & Zimmerman)
Solution manual Applied Combinatorics (5th Ed., Alan Tucker)
Solution manual Vector Calculus (Miroslav Lovric)
Solution manual Applied Multivariate Techniques (Subhash Sharma)
Solution manual Mathematical Modeling (3rd Ed., Mark Meerschaert)
Solution manual Discrete Mathematics : Mathematical Reasoning and Proof with Puzzles, Patterns, and Games (Douglas Ensley, J. Winston Crawley)
Solution manual Probability, Random Variables and Random Signal Principles (4th Ed., Peyton Z., Jr. Peebles)
Solution manual Introduction to C++, Excel MATLAB & Basic Engineering Numerical Methods V1.1 (Harvey Stenger & Charles Smith)
Solution manual Numerical Methods for Engineers and Scientists : An Introduction with Applications Using MATLAB (1st Ed., Amos Gilat & Vish Subramaniam)
Solution manual Numerical Methods for Engineers and Scientists : An Introduction with Applications Using MATLAB (2nd Ed., Amos Gilat & Vish Subramaniam)
Solution manual MATLAB : An Introduction with Applications (2nd Ed., Amos Gilat)
Solution manual MATLAB : An Introduction with Applications (3rd Ed., Amos Gilat)
Solution manual MATLAB : An Introduction with Applications (4th Ed., Amos Gilat)
Solution manual Matlab : A Practical Introduction to Programming and Problem Solving (Stormy Attaway)
Solution manual Data, Statistics, and Decision Models with Excel (Harnett & Horrell)
Solution manual Understanding Analysis (Stephen Abbott)
Solution manual Time Series Analysis With Applications in R (2nd Ed., Jonathan D. Cryer & Kung-Sik Chan)
Solution manual Time Series Analysis and Its Applications : With R Examples (2nd Ed., Robert Shumway & David Stoffer)
Solution manual Doing Statistics for Business with Excel : Data, Inference, and Decision Making (2nd Ed. Pelosi & Sandifer)
Solution manual Engineering with Excel (3rd Ed., Ronald W. Larsen)
Solution manual Spreadsheet Tools for Engineers Using Excel 2007 (Byron Gottfried)
Solution manual Spreadsheet Tools for Engineers using Excel (2nd Ed. Byron Gottfried)
Solution manual Spreadsheet Tools for Engineers using Excel (3rd Ed. Byron Gottfried)
Solution manual Introduction to Matlab 7 (Etter, Kuncicky & Moore)
Solution manual Introduction to Matlab 6 for Engineers (1st Ed., William Palm III)
Solution manual Introduction to Matlab 7 for Engineers (2nd Ed.,

William Palm III)
Solution manual Introduction to Matlab for Engineers (3rd Ed., William Palm III)
Solution manual A Concise Introduction to MATLAB (William J Palm III)
Solution manual Numerical Methods for Engineers (4th Ed. Steven Chapra, Raymond Canale)
Solution manual Numerical Methods for Engineers (5th Ed. Steven Chapra, Raymond Canale)
Solution manual Numerical Methods for Engineers (6th Ed. Steven Chapra, Raymond Canale)
Solution manual Applied Numerical Methods with MATLAB for Engineers and Scientists (1st Ed., Steven Chapra)
Solution manual Applied Numerical Methods with MATLAB for Engineers and Scientists (2nd Ed., Steven Chapra)
Solution manual Applied Numerical Methods with MATLAB for Engineers and Scientists (3rd Ed., Steven Chapra)
Solution manual MATLAB for Engineers (1st Ed., Holly Moore)
Solution manual MATLAB for Engineers (2nd Ed., Holly Moore)
Solution manual Statistics for Engineers and Scientists (1st Ed., William Navidi)
Solution manual Statistics for Engineers and Scientists (2nd Ed., William Navidi)
Solution manual Statistics for Engineers and Scientists (3rd Ed., William Navidi)
Solution manual Principles of Statistics for Engineers and Scientists (William Navidi)
Solution manual Probability (Jim Pitman)
Solution manual Basic Probability Theory (Robert B. Ash)
Solution manual An Introduction to Stochastic Modeling (3rd Ed., Samuel Karlin)
Solution manual Stochastic Calculus for Finance (Steven E. Shreve)
Solution manual Markov Processes for Stochastic Modeling (Oliver Ibe)
Solution manual Mathematical Statistics with Applications (K.M. Ramachandran & Chris Tsokos)
Solution manual Probability : A Graduate Course (Allan Gut)
Solution manual Linear Algebra Done Right (2nd Ed., Sheldon Axler)
Solution manual Precalculus : A Prelude to Calculus (Sheldon Axler)
Solution manual Statistics for Business (Derek Waller)
Solution manual An Introduction to the Mathematics of Financial Derivatives (2nd Ed., Salih Neftci)
Solution manual Elementary Number Theory with Applications (2nd Ed., Thomas Koshy)
Solution manual Introduction to Probability Models (9th Ed., Sheldon Ross)
Solution manual Introduction to Probability Models (10th Ed., Sheldon Ross)
Solution manual Introductory Statistics (2nd Ed., Sheldon Ross)
Solution manual Introductory Statistics (3rd Ed., Sheldon Ross)
Solution manual Introduction to Probability and Statistics for Engineers and Scientists (4th Ed., Sheldon Ross)

Solution manual Basic Mathematics through Applications (4th Ed. by Akst, Bragg)
Solution manual Developmental Mathematics (6th Ed., Bittinger & Beecher)
Solution manual Developmental Mathematics (7th Ed., Bittinger & Beecher)
Solution manual Developmental Mathematics : Basic Mathematics and Algebra (1st Ed., Lial, Hornsby, McGinnis, Salzman & Hestwood)
Solution manual Developmental Mathematics : Basic Mathematics and Algebra (2nd Ed., Lial, Hornsby, McGinnis, Salzman & Hestwood)
Solution manual Essential Mathematics (2nd Ed., Margaret Lial & Stanley Salzman)
Solution manual Essential Mathematics (3rd Ed., Margaret Lial & Stanley Salzman)
Solution manual Prealgebra & Introductory Algebra (2nd Ed. by Elayn El Martin-Gay)
Solution manual Prealgebra (5th Ed., Bittinger, Ellenbogen & Johnson)
Solution manual Prealgebra (5th Ed., Elayn El Martin-Gay)
Solution manual Prealgebra : An Integrated Approach (Lial & Hestwood)
Solution manual Integrated Arithmetic and Basic Algebra (4th Ed., Jordan & Palow)
Solution manual Introductory Algebra through Applications (1st Ed., Akst & Bragg)
Solution manual Introductory Algebra through Applications (2nd Ed., Akst & Bragg)
Solution manual Beginning Algebra (10th Ed., Lial, Hornsby & McGinnis)
Solution manual Elementary Algebra Early Graphing for College Students (3rd Ed., Allen R. Angel)
Solution manual Intermediate Algebra with Applications & Visualization (3rd Ed., Rockswold & Krieger)
Solution manual Intermediate Algebra (10th Ed., Lial, Hornsby & McGinnis)
Solution manual Beginning and Intermediate Algebra (4th Ed., Lial, Hornsby & McGinnis)
Solution manual Elementary and Intermediate Algebra : Graphs & Models (3rd Ed., Bittinger, Ellenbogen & Johnson)
Solution manual Algebra for College Students (4th Ed., Mark Dugopolski)
Solution manual Algebra for College Students (5th Ed., Mark Dugopolski)
Solution manual Algebra For College Students (6th Ed., Robert F Blitzer)
Solution manual Algebra for College Students (3rd Ed., Allen R. Angel)
Solution manual Algebra for College Students (6th Ed., Lial, Hornsby & McGinnis)
Solution manual Statistics, Data Analysis, and Decision Modeling (3rd Ed., James Evans)
Solution manual Statistics, Data Analysis, and Decision Modeling (4th Ed., James Evans)
Solution manual College Geometry : A Discovery Approach (2nd Ed.,

David Kay)
Solution manual College Geometry : Using The Geometer's Sketchpad - Preliminary Edition (Barbara Reynolds & William Fenton)
Solution manual College Geometry : A Problem Solving Approach with Applications (2nd Ed., Musser, Trimpe & Maurer)
Solution manual A Survey of Mathematics with Applications (8th Ed., Angel, Abbott & Runde)
Solution manual A Survey of Mathematics with Applications: Expanded Edition (8th Ed., Angel, Abbott & Runde)
Solution manual Mathematical Ideas (11th Ed., Miller, Heeren & Hornsby)
Solution manual Mathematical Ideas: Expanded Edition (11th Ed., Miller, Heeren & Hornsby)
Solution manual Mathematical Thinking : Problem-Solving and Proofs (2nd Ed., John P. D'Angelo & Douglas B. West)
Solution manual Thinking Mathematically (4th Ed., Robert F. Blitzer)
Solution manual Introduction to Mathematical Thinking: Algebra and Number Systems (Will J. Gilbert & Scott A. Vanstone)
Solution manual Mathematical Reasoning : Writing and Proof (1st Ed., Ted A. Sundstrom)
Solution manual Mathematical Reasoning : Writing and Proof (2nd Ed., Ted A. Sundstrom)
Solution manual Mathematical Reasoning for Elementary Teachers (4th Ed., Calvin T. Long & Duane W. DeTemple)
Solution manual Mathematical Reasoning for Elementary Teachers (5th Ed., Long, DeTemple & Millman)
Solution manual Mathematics for Elementary School Teachers (4th Ed., O'Daffer, Charles, Cooney, Dossey & Schielack)
Solution manual Mathematics for Elementary Teachers (2nd Ed., Sybilla Beckmann)
Solution manual Finite Mathematics and Calculus with Applications (7th Ed., Lial, Greenwell & Ritchey)
Solution manual Finite Mathematics and Calculus with Applications (8th Ed., Lial, Greenwell & Ritchey)
Solution manual Additional Calculus Topics (11th Ed., Barnett, Ziegler & Byleen)
Solution manual College Mathematics for Business, Economics, Life Sciences & Social Sciences (11th Ed., Barnett, Ziegler & Byleen)
Solution manual Introductory Mathematical Analysis for Business, Economics and the Life and Social Sciences (12th Ed., Haeussler, Paul & Wood)
Solution manual Finite Mathematics for Business, Economics, Life Sciences and Social Sciences (11th Ed., Barnett, Ziegler, Byleen)
Solution manual Finite Mathematics (9th Ed., Lial, Greenwell & Ritchey)
Solution manual Calculus and Its Applications (9th Ed., Bittinger & Ellenbogen)
Solution manual Calculus for Business, Economics, Life Sciences & Social Sciences (11th Ed., Barnett, Ziegler & Byleen)
Solution manual Calculus with Applications (9th Ed., Lial, Greenwell &

Ritchey)
Solution manual Calculus with Applications : Brief Version (9th Ed., Lial, Greenwell & Ritchey)
Solution manual Concepts of Calculus with Applications (Martha Goshaw)
Solution manual University Calculus : Elements with Early Transcendentals (Hass, Weir & Thomas, Jr.)
Solution manual Thomas' Calculus, Early Transcendentals: Media Upgrade (11th Ed., Thomas Jr., Weir, Hass & Giordano)
Solution manual Thomas' Calculus: Media Upgrade (11th Ed., Thomas Jr., Weir, Hass & Giordano)
Solution manual University Calculus : Alternate Edition (Hass, Weir & Thomas, Jr.)
Solution manual Differential Equations Computing and Modeling (4th Ed., Edwards & Penney)
Solution manual Differential Equations and Boundary Value Problems : Computing and Modeling (4th Ed., Edwards & Penney)
Solution manual Elementary Differential Equations with Boundary Value Problems (6th Ed., Edwards & Penney)
Solution manual Elementary Differential Equations (6th Ed., Edwards & Penney)
Solution manual Fundamentals of Differential Equations (7th Ed., Nagle, Saff & Snider)
Solution manual Fundamentals of Differential Equations with Boundary Value Problems (5th Ed., Nagle, Saff & Snider)
Solution manual Differential Equations and Linear Algebra (3rd Ed., Goode & Annin)
Solution manual Discrete Mathematical Structures (6th Ed., Kolman, Busby & Ross)
Solution manual College Algebra Enhanced with Graphing Utilities (5th Ed., Sullivan & Sullivan III)
Solution manual College Algebra (10th Ed., Lial, Hornsby & Schneider)
Solution manual College Algebra : Graphs and Models (4th Ed., Bittinger, Beecher, Ellenbogen & Penna)
Solution manual College Algebra Essentials (8th Ed., Michael Sullivan)
Solution manual College Algebra (3rd Ed., Judith A. Beecher, Judith A. Penna & Marvin L. Bittinger)
Solution manual College Algebra (8th Ed., Michael Sullivan)
Solution manual Algebra and Trigonometry for College Readiness (Margaret L. Lial & John Hornsby)
Solution manual Algebra and Trigonometry Enhanced with Graphing Utilities (5th Ed., Sullivan & Sullivan III)
Solution manual Algebra and Trigonometry : Graphs & Models (4th Ed., Bittinger, Beecher, Ellenbogen & Penna)
Solution manual Trigonometry : A Unit Circle Approach (8th Ed., Michael Sullivan)
Solution manual Precalculus (3rd Ed., Lial, Hornsby & Schneider)
Solution manual Precalculus (4th Ed., Lial, Hornsby & Schneider)
Solution manual Precalculus : Enhanced with Graphing Utilities (5th Ed., Sullivan & Sullivan III)
Solution manual Precalculus : Functions and Graphs (3rd Ed. Mark

Dugopolski)
Solution manual Precalculus : Graphs & Models and Graphing (4th Ed., Bittinger, Beecher, Ellenbogen & Penna)
Solution manual Discrete and Combinatorial Mathematics (5th ed., Ralph P. Grimaldi)
Solution manual Discrete Mathematics (Sherwood Washburn, Thomas Marlowe & Charles T. Ryan)
Solution manual Discrete Mathematics (5th ed., John Dossey, Albert Otto, Lawrence Spence & Charles Vanden Eynden)
Solution manual Mathematics for New Technologies (Don Hutchison & Mark Yannotta)
Solution manual Fundamental Finite Element Analysis and Applications: with Mathematica and Matlab Computations (Asghar Bhatti)
Solution manual Advanced Topics in Finite Element Analysis of Structures: With Mathematica and MATLAB Computations (Asghar Bhatti)
Solution manual The Finite Element Method in Engineering (4th Ed., by Rao)
Solution manual An Introduction to the Finite Element Method (3rd Ed., J. N. Reddy)
Solution manual Fundamentals of Finite Element Analysis (1st Ed., David V. Hutton)
Solution manual Simulation Modeling and Analysis (3rd Ed., Averill Law & David Kelton)
Solution manual Simulation Modeling and Analysis (4th Ed., Averill Law)
Solution manual The Finite Element Method : Its Basis and Fundamentals (6th Ed., Zienkiewicz, R. L. Taylor & J.Z. Zhu)
Solution manual Algebra : Form and Function (William McCallum, Eric Connally & Deborah Hughes-Hallett)
Solution manual Algebra : Form and Function, Preliminary Edition (William McCallum, Eric Connally & Deborah Hughes-Hallett)
Solution manual Applied Calculus (2nd Ed., Deborah Hughes-Hallett, et al.)
Solution manual Applied Calculus (3rd Ed., Deborah Hughes-Hallett, et al.)
Solution manual Applied Calculus (4th Ed., Deborah Hughes-Hallett, et al.)
Solution manual Calculus : Multivariable (3rd Ed., William G. McCallum, Deborah Hughes-Hallett, et al.)
Solution manual Calculus : Multivariable (4th Ed., William G. McCallum, Deborah Hughes-Hallett, et al.)
Solution manual Calculus : Multivariable (5th Ed., William G. McCallum, Deborah Hughes-Hallett, et al.)
Solution manual Calculus : Single Variable (3rd Ed., Deborah Hughes-Hallett, Andrew M. Gleason, et al.)
Solution manual Calculus : Single Variable (4th Ed., Deborah Hughes-Hallett, Andrew M. Gleason, et al.)
Solution manual Calculus : Single Variable (5th Ed., Deborah Hughes-Hallett, Andrew M. Gleason, et al.)
Solution manual Calculus : Single and Multivariable (3rd Ed., Deborah

Hughes-Hallett, Andrew M. Gleason, et al.)
Solution manual Calculus : Single and Multivariable (4th Ed., Deborah Hughes-Hallett, Andrew M. Gleason, et al.)
Solution manual Calculus : Single and Multivariable (5th Ed., Deborah Hughes-Hallett)
Solution manual Functions Modeling Change : A Preparation for Calculus - Texas Edition (2nd Ed., Eric Connally, Deborah Hughes-Hallett & Andrew M. Gleason)
Solution manual Functions Modeling Change : A Preparation for Calculus (2nd Ed., Eric Connally, Deborah Hughes-Hallett, et al.)
Solution manual Functions Modeling Change : A Preparation for Calculus (3rd Ed., Eric Connally)
Solution manual Differential Equations (A. King, J. Billingham, S. Otto)
Solution manual Regression Methods in Biostatistics : Linear, Logistic, Survival, and Repeated Measures Models (Eric Vittinghoff, David Glidden, Stephen Shiboski, Charles McCulloch)
Solution manual A Modern Introduction to Probability and Statistics : Understanding Why and How (F.M. Dekking, C. Kraaikamp, H.P. Lopuhaä, L.E. Meester)
Solution manual Statistical Methods for the Analysis of Repeated Measurements (Charles S. Davis)
Solution manual Bayesian Core : A Practical Approach to Computational Bayesian Statistics (Jean-Michel Marin, Christian Robert)
Solution manual The Bayesian Choice : From Decision-Theoretic Foundations to Computational Implementation (2nd Ed., Christian Robert)
Solution manual Essentials of Stochastic Processes (Rick Durrett)
Solution manual Methods of Multivariate Statistics (Muni Srivastava)
Solution manual Regression Analysis : Theory, Methods, and Applications (Ashish Sen & Muni Srivastava)
Solution manual Applied Probability and Statistics (Mario Lefebvre)
Solution manual Basic Probability Theory with Applications (Mario Lefebvre)
Solution manual Foundations of Hyperbolic Manifolds (2nd Ed., John Ratcliffe)
Solution manual Fourier and Laplace Transforms (R. J. Beerends , H. G. ter Morsche)
Solution manual Infinite-Dimensional Dynamical Systems (James C. Robinson)
Solution manual Mathematical Methods for Physics and Engineering, (3rd Ed., Riley, Hobson & Bence)
Solution manual Numerical Methods in Engineering with MATLAB (Jaan Kiusalaas)
Solution manual Numerical Methods in Engineering with Python (Jaan Kiusalaas)
Solution manual An Introduction to Numerical Analysis (Endre Suli and David Mayers)
Solution manual Fundamentals of Engineering Numerical Analysis (Parviz Moin)

Solution manual Statistical Design (George Casella)
Solution manual Statistical Inference (2nd Ed., George Casella, Roger L. Berger)
Solution manual Monte Carlo Statistical Methods (2nd Ed., Christian P. Robert, George Casella)
Solution manual Introducing Monte Carlo Methods with R (Christian Robert & George Casella)
Solution manual Introduction to Mathematical Structures and Proofs (Larry J. Gerstein)
Solution manual Analyzing Categorical Data (Jeffrey S. Simonoff)
Solution manual Fundamentals of Complex Analysis with Applications to Engineering, Science, and Mathematics (3rd Ed., E. Saff & Arthur Snider)
Solution manual Probability & Statistics for Engineers & Scientists (8th Ed., Walpole, Myers, Ye)
Solution manual Probability & Statistics for Engineers & Scientists (9th Ed., Walpole, Myers, Ye)
Solution manual Statistics for Engineering and the Sciences (5th Ed., Mendenhall & Sincich)

List of Solutions Manuals and Test Banks

---

contact me to : mattosbw1@gmail.com
mattosbw1(at)gmail.com

NOTE : "THIS SERVICE IS NOT AVAILABLE FOR : CHINA, INDIA, RUSSIA, PAKISTAN, IRAQ, IRAN, PHILIPPINES, NORTH KOREA, NEPAL, BANGLADESH, SRI LANKA, MALDIVES, BHUTAN & COLOMBIA".

If your wanted solutions manual is not in this list, also can ask me if is available (it is a partial list). Then if you need solutions manual only contact me by email.

"ARE NOT AVAILABLES BOOKS IN DIGITAL FORMAT", ONLY SOLUTIONS MANUALS AND TEST BANKS.

This same "list of titles" of texts with availables solutions manual and/or test banks is for download from :

http://www.megaupload.com/?d=ADDS77XH

I do not review the forums, just send me an email.

- Math, Statistics & Probability :

Solution manual A Second Course in Statistics : Regression Analysis (6th Ed., Mendenhall & Sincich)
Solution manual A Second Course in Statistics : Regression Analysis (7th Ed., Mendenhall & Sincich)
Solution manual Miller & Freund's Probability and Statistics for Engineers (7th Ed., Johnson, Miller, Freund)
Solution manual Miller & Freund's Probability and Statistics for Engineers (8th Ed., Johnson, Miller, Freund)
Solution manual Numerical Methods Using Matlab (4th Ed., Mathews & Fink)
Solution manual Applied Numerical Analysis Using MATLAB (2nd Ed., Laurene v. Fausett)
Solution manual Applied Numerical Analysis (7th Ed., Curtis F. Gerald, Patrick O. Wheatley)
Solution manual Friendly Introduction to Numerical Analysis (Bradie)
Solution manual Elementary Linear Algebra (2nd Ed., Spence, Insel & Friedberg)
Solution manual Elementary Linear Algebra with Applications (9th Ed., Kolman & Hill)

Solution manual Introductory Linear Algebra : An Applied First Course (8th Ed., Kolman & Hill)
Solution manual Linear Algebra with Applications (6th Ed., S. Leon)
Solution manual Linear Algebra with Applications (7th Ed., S. Leon)
Solution manual Linear Algebra for Engineers and Scientists Using Matlab (Hardy)
Solution manual Linear Algebra with Applications (3rd Ed., Bretscher)
Solution manual Linear Algebra with Applications (4th Ed., Bretscher)
Solution manual Modern Matrix Algebra (Hill & Kolman)
Solution manual Matrix Methods : Applied Linear Algebra (3rd Ed., Richard Bronson & Gabriel B. Costa)
Solution manual A Transition to Abstract Mathematics : Learning Mathematical Thinking and Writing (2nd Ed., Randall Maddox)
Solution manual Partial Differential Equations and Boundary Value Problems with Fourier Series (2nd ed., Asmar)
Solution manual Applied Partial Differential Equations (4th Ed., Haberman)
Solution manual Technical Calculus (5th Ed., Dale Ewen, Joan S. Gary & James E. Trefzger)
Solution manual Technical Mathematics (2th Ed., Dale Ewen, Joan S. Gary & James E. Trefzger)
Solution manual Technical Mathematics with Calculus (2th Ed., Dale Ewen, Joan S. Gary & James E. Trefzger)
Solution manual Introductory Mathematics (4th Ed., Cook)
Solution manual Mathematics for the Technical Trades (Cook)
Solution manual College Mathematics (7th Ed., Cleaves & Hobbs)
Solution manual Fundamentals of Statistics (2nd Ed., Michael III Sullivan)
Solution manual Fundamentals of Statistics (3rd Ed., Michael III Sullivan)
Solution manual Statistics : Informed Decisions Using Data (2nd Ed., Michael III Sullivan)
Solution manual Modern Elementary Statistics (12th Ed., John E. Freund, Benjamin M. Perles)
Solution manual Statistics : The Art and Science of Learning From Data (Agresti & Franklin)
Solution manual Statistics : The Art and Science of Learning From Data (2nd Ed., Agresti & Franklin)
Solution manual Elementary Statistics : Picturing the World (3rd Ed., Larson & Farber)
Solution manual Elementary Statistics : Picturing the World (4th Ed., Larson & Farber)
Solution manual Elementary Statistics : Picturing the World (5th Ed., Larson & Farber)
Solution manual A First Course in Statistics (9th Ed., McClave & Sincich)
Solution manual A First Course in Statistics (10th Ed., McClave & Sincich)
Solution manual Statistics (10th Ed., McClave & Terry Sincich)
Solution manual Statistics (11th Ed., McClave & Terry Sincich &

William Mendenhall)
Solution manual Interactive Statistics (3rd Ed., Martha Aliaga & Brenda Gunderson)
Solution manual Statistics for the Life Sciences (3rd Ed., Samuels & Witmer)
Solution manual Statistics for the Life Sciences (4th Ed., Samuels, Witmer & Schaffner)
Solution manual Applied Statistics and the SAS Programming Language (5th Ed., Cody & Smith)
Solution manual Biostatistics for the Health Sciences (R. Clifford Blair & Richard Taylor)
Solution manual Biostatistics : How It Works (Steve Selvin)
Solution manual Business Statistics : First Course (4th Ed., Levine, Krehbiel & Berenson)
Solution manual Business Statistics : First Course (5th Ed., Levine, Krehbiel & Berenson)
Solution manual Course in Business Statistics (4th Ed., Groebner, Shannon, Fry & Smith)
Solution manual Business Statistics : A Decision Making Approach (6th Ed., Groebner, Shannon, Fry & Smith)
Solution manual Business Statistics : A Decision-Making Approach (7th Ed., Groebner, Shannon, Fry & Smith)
Solution manual Business Statistics : A Decision-Making Approach (8th Ed., Groebner, Shannon, Fry & Smith)
Solution manual Statistics for Business & Economics (10th Ed., McClave, Benson & Sincich)
Solution manual Statistics for Managers Using Excel (5th Ed., Levine)
Solution manual Statistics for Managers Using Microsoft Excel (4th Ed., Levine, Stephan, Krehbiel & Berenson)
Solution manual Statistics for Business and Economics (5th Ed., Newbold, Carlson & Thorne)
Solution manual Statistics for Business and Economics (6th Ed., Newbold, Carlson & Thorne)
Solution manual Statistics for Business and Economics (7th Ed., Newbold, Carlson & Thorne)
Solution manual Basic Business Statistics : Concepts and Applications (10th Ed., Berenson, Krehbiel & Levine)
Solution manual Basic Business Statistics (11th Ed., Berenson, Levine & Krehbiel)
Solution manual John E. Freund's Mathematical Statistics with Applications (7th Ed., Miller)
Solution manual Probability and Statistical Inference (7th Ed., Hogg & Tanis)
Solution manual Probability and Statistical Inference (8th Ed., Hogg & Tanis)
Solution manual Introduction to Mathematical Statistics (6th Ed., Hogg, Craig & McKean)
Solution manual Introduction to Mathematical Statistics and Its Applications (4th Ed., Larsen & Marx)
Solution manual Introduction to Mathematical Statistics and Its

Applications (5th Ed., Larsen & Marx)
Solution manual A Brief Course in Mathematical Statistics (Hogg & Tanis)
Solution manual Fundamentals of Probability, with Stochastic Processes (3rd Ed., Saeed Ghahramani)
Solution manual A First Course in Probability (7th Ed., Sheldon Ross)
Solution manual A First Course in Probability (8th Ed., Sheldon Ross)
Solution manual Applied Multivariate Statistical Analysis (6th Ed., Johnson & Wichern)
Solution manual Multivariate Data Analysis (6th Ed., Hair, Black, Babin, Anderson & Tatham)
Solution manual Multivariate Data Analysis (7th Ed., Hair, Black, Babin, Anderson)
Solution manual Essential MATLAB for Engineers and Scientists (3rd Ed., Brian Hahn & Dan Valentine)
Solution manual Essential MATLAB for Engineers and Scientists (4th Ed., Brian Hahn & Dan Valentine)
Solution manual Introduction to Applied Statistical Signal Analysis : Guide to Biomedical and Electrical Engineering Applications (3rd Ed. Richard Shiavi)
Solution manual Construction Mathematics (Surinder Virdi & Roy Baker)
Solution manual Numerical Methods in Biomedical Engineering (Stanley Dunn, Alkis Constantinides & Prabhas Moghe)
Solution manual Probability and Statistics with Integrated Software Routines (Ronald Deep)
Solution manual Finite Element Analysis with Error Estimators : An Introduction to the FEM and Adaptive Error Analysis for Engineering Students (J. Akin)
Solution manual Basic Engineering Mathematics (4th Ed., John Bird)
Solution manual Engineering Mathematics (4th Ed., John Bird)
Solution manual Engineering Mathematics (5th Ed., John Bird)
Solution manual Higher Engineering Mathematics (5th Ed., John Bird)
Solution manual Construction Mathematics (Virdi & Baker)
Solution manual Mathematics for Electrical Engineering and Computing (Mary Attenborough)
Solution manual Probability and Random Processes : With Applications to Signal Processing and Communications (Miller & Childers)
Solution manual Introductory Statistics for Engineering Experimentation (Peter Nelson, Karen Copeland & Marie Coffin)
Solution manual Understanding Engineering Mathematics (Bill Cox)
Solution manual Statistics And Probability For Engineering Applications With Microsoft Excel (Decoursey)
Solution manual Business Math Using Calculators : With 10-Key Computer Assisted Instruction (Burton)
Solution manual Mathematics for Economics and Business (5th Ed., Ian Jacques)
Solution manual Business Math, Brief (7th Ed., Cleaves & Hobbs)
Solution manual Math for Merchandising: A Step-by-Step Approach (3rd Ed., Moore)
Solution manual Mathematics for Business (7th Ed., Salzman , Miller &

Clendenen)
Solution manual Mathematics for Business (8th Ed., Salzman , Miller & Clendenen)
Solution manual Basic College Mathematics with Early Integers (K. Elayn Martin-Gay)
Solution manual Developmental Mathematics (K. Elayn Martin-Gay)
Solution manual An Introduction to Analysis (3rd Ed., William Wade)
Solution manual An Introduction to Analysis (4th Ed., William Wade)
Solution manual A Friendly Introduction to Analysis (2nd Ed., Witold A.J. Kosmala)
Solution manual Advanced Calculus (Gerald Folland)
Solution manual Analysis : With an Introduction to Proof (4th Ed., Steven R. Lay)
Solution manual Essentials of Basic College Mathematics (John Jr Tobey, Jr., Jeffrey Slater)
Solution manual Basic College Mathematics (5th Ed., John Tobey & Jeffrey Slater)
Solution manual Prealgebra (3rd Ed., Jamie Blair, John Tobey & Jeffrey Slater)
Solution manual Elementary Algebra Early Graphing for College Students (3rd Ed., Allen Angel)
Solution manual Elementary Algebra (Michael Sullivan III, Katherine R. Struve & Janet Mazzarella)
Solution manual Elementary Algebra for College Students (7th Ed., Allen R. Angel)
Solution manual Experiencing Introductory and Intermediate Algebra Through Functions and Graphs (3rd Ed., JoAnne Thomasson & Robert Pesut)
Solution manual Introductory Algebra (3rd Ed., K. Elayn Martin-Gay)
Solution manual Beginning Algebra (6th Ed., John Jr Tobey & Jeffrey Slater)
Solution manual Beginning Algebra : Early Graphing (Jamie Blair, John Tobey & Jeffrey Slater)
Solution manual Beginning and Intermediate Algebra (2nd Ed., Jamie Blair, John Tobey & Jeffrey Slater)
Solution manual Introductory Algebra (4th Ed., Robert Blitzer)
Solution manual Introductory and Intermediate Algebra (2nd Ed., Robert Blitzer)
Solution manual Intermediate Algebra for College Students (7th Ed., Allen Angel)
Solution manual Intermediate Algebra (Michael Sullivan III & Katherine Struve)
Solution manual Intermediate Algebra (3rd Ed., K. Elayn Martin-Gay)
Solution manual Essentials of Intermediate Algebra for College Students (Robert Blitzer)
Solution manual Intermediate Algebra (4th Ed., Robert Blitzer)
Solution manual Intermediate Algebra for College Students (5th Ed., Robert Blitzer)
Solution manual Algebra A Combined Approach (3rd Ed., K. Elayn Martin-Gay)

Solution manual Elementary & Intermediate Algebra (Michael Sullivan III, Katherine R. Struve & Janet Mazzarella)
Solution manual Essentials of Introductory and Intermediate Algebra for College Students (Robert F. Blitzer)
Solution manual Algebra for College Students (3rd Ed., Allen R. Angel)
Solution manual Algebra for College Students (5th Ed., Robert F Blitzer)
Solution manual College Algebra (8th Ed., Michael Sullivan)
Solution manual College Algebra Essentials (8th Ed., Michael Sullivan)
Solution manual College Algebra (4th Ed., Robert Blitzer)
Solution manual College Algebra Essentials (2nd Ed., Robert F. Blitzer)
Solution manual College Algebra : An Early Functions Approach (Robert F. Blitzer)
Solution manual College Algebra : Concepts Through Functions (1st Ed., Michael Sullivan III & Michael Sullivan)
Solution manual College Algebra : Concepts Through Functions (2nd Ed., Michael Sullivan III & Michael Sullivan)
Solution manual College Algebra Enhanced with Graphing Utilities (4th Ed., Michael Sullivan III & Michael Sullivan)
Solution manual Essentials of College Algebra : Enhanced with Graphing Utilities (4th Ed., Michael Sullivan III & Michael Sullivan)
Solution manual Algebra and Trigonometry (8th Ed., Michael Sullivan)
Solution manual Algebra and Trigonometry (3rd Ed., Robert F. Blitzer)
Solution manual Algebra and Trigonometry: An Early Functions Approach (Robert Blitzer)
Solution manual Algebra & Trigonometry (7th Ed., Michael Sullivan)
Solution manual Algebra and Trigonometry Enhanced With Graphing Utilities (4th Ed., Michael Sullivan III & Michael Sullivan)
Solution manual Trigonometry (7th Ed., Michael Sullivan)
Solution manual Trigonometry (8th Ed., Michael Sullivan)
Solution manual Trigonometry Enhanced with Graphing Utilities (4th Ed., Michael Sullivan III & Michael Sullivan)
Solution manual Precalculus (8th Ed., Michael Sullivan)
Solution manual Precalculus (3rd Ed., Robert Blitzer)
Solution manual Precalculus (4th Ed., Robert Blitzer)
Solution manual Precalculus (1st Ed., J. S. Ratti & Marcus S. McWaters)
Solution manual Precalculus : A Right Triangle Approach (2nd Ed., J. S. Ratti & Marcus S. McWaters)
Solution manual Precalculus Essentials (2nd Ed., Robert Blitzer)
Solution manual Precalculus Essentials (3rd Ed., Robert Blitzer)
Solution manual Precalculus : Concepts Through Functions, A Unit Circle Approach to Trigonometry (1st Ed., Michael Sullivan III & Michael Sullivan)
Solution manual Precalculus : Concepts Through Functions, A Unit Circle Approach to Trigonometry (2nd Ed., Michael Sullivan III & Michael Sullivan)
Solution manual Precalculus : Concepts Through Functions, A Right Triangle Approach to Trigonometry (1st Ed., Michael Sullivan III &

Michael Sullivan)
Solution manual Precalculus : Concepts Through Functions, A Right Triangle Approach to Trigonometry (2nd Ed., Michael Sullivan III & Michael Sullivan)
Solution manual Precalculus Enhanced with Graphing Utilities (4th Ed., Michael Sullivan III & Michael Sullivan)
Solution manual Precalculus Enhanced with Graphing Utilities (5th Ed., Michael Sullivan III & Michael Sullivan)
Solution manual Precalculus Essentials : Enhanced with Graphing Utilities (4th Ed., Michael Sullivan III & Michael Sullivan)
Solution manual Excursions in Modern Mathematics (5th Ed., Peter Tannenbaum)
Solution manual Excursions In Modern Mathematics with Mini-Excursions (6th Ed., Peter Tannenbaum)
Solution manual Quantitive Reasoning & the Environment (Greg Langkamp & Joseph Hull)
Solution manual Fundamentals of Mathematics (10th Ed., William M Setek & Michael A Gallo)
Solution manual Learning Math in Elementary and Middle School & IMAP Package (4th Ed., Cathcart, Pothier, Vance & Bezuk)
Solution manual Understanding the Math You Teach: Content and Methods for Prekindergarten Through Grade 4 (Anita C. Burris)
Solution manual Algebra Connections (Ira J. Papick & UMO University of Missouri)
Solution manual Calculus Connections (Asma Harcharras, Dorina Mitrea)
Solution manual Data Analysis and Probability Connections: Mathematics for Middle School Teachers (Debra A. Perkowski & Michael Perkowski)
Solution manual Geometry Connections (John K. Beem)
Solution manual Elementary Math Modeling Updated (2nd Ed., Mary Ellen Davis & C. Henry Edwards)
Solution manual Additional Calculus Topics (11th Ed., Raymond Barnett, Michael Ziegler & Karl Byleen)
Solution manual Finite Math and Its Application (9th Ed., Larry J Goldstein, David I Schneider & Martha J. Siegel)
Solution manual Finite Mathematics and Its Application (10th Ed., Larry J Goldstein, David I Schneider & Martha J. Siegel)
Solution manual Introductory Mathematical Analysis for Business, Economics and the Life and social Sciences (11th Ed., Haeussler, Paul & R.J. Wood)
Solution manual Introductory Mathematical Analysis for Business, Economics and the Life and Social Sciences (12th Ed., Haeussler, Paul & R.J. Wood)
Solution manual Additional Calculus Topics (9th Ed., Raymond Barnett, Michael Ziegler & Karl Byleen)
Solution manual College Mathematics for Business, Economics, Life Sciences and Social Sciences (10th Ed., Raymond Barnett, Michael Ziegler & Karl Byleen)
Solution manual Brief Calculus and Its Applications (11th Ed., Larry Goldstein, David Schneider, David Lay & Nakhle Asmar)
Solution manual Brief Calculus and Its Applications (12th Ed., Larry

Goldstein, David Schneider, David Lay & Nakhle Asmar)
Solution manual Calculus and its Applications (10th Ed., Larry Goldstein, David Schneider, David Lay)
Solution manual Calculus and its Applications (11th Ed., Larry Goldstein, David Schneider, David Lay & Nakhle Asmar)
Solution manual Calculus and its Applications (12th Ed., Larry Goldstein, David Schneider, David Lay & Nakhle Asmar)
Solution manual Calculus for Business, Economics, Life Sciences and Social Sciences (10th Ed., Raymond Barnett, Michael Ziegler & Karl Byleen)
Solution manual Calculus, Early Transcendentals (6th Ed., C. Henry Edwards & David Penney)
Solution manual Calculus, Early Transcendentals (7th Ed., C. Henry Edwards & David Penney)
Solution manual Calculus (9th Ed., Dale Varberg, Edwin Purcell & Steve Rigdon)
Solution manual Calculus Early Transcendentals (Dale Varberg, Edwin Purcell & Steve Rigdon)
Solution manual Calculus (3rd Ed., Monty Strauss, Gerald Bradley & Karl Smith)
Solution manual Calculus (6th Ed., Henry Edwards & David E. Penney)
Solution manual Single Variable Calculus (3rd Ed., Monty Strauss, Gerald Bradley & Karl Smith)
Solution manual Vector Calculus (3rd Ed., Susan Colley)
Solution manual Applied Linear Algebra (Peter Olver & Cheri Shakiban)
Solution manual Differential Equations and Linear Algebra (2nd Ed., Jerry Farlow, James E. Hall, Jean Marie McDill & Beverly West)
Solution manual Differential Equations and Linear Algebra (2nd Ed., C. Henry Edwards & David Penney)
Solution manual Differential Equations and Linear Algebra (3rd Ed., C. Henry Edwards & David Penney)
Solution manual Differential Equations (2nd Ed., John Polking, Al Boggess & David Arnold)
Solution manual Differential Equations with Boundary Value Problems (2nd ed., John Polking, Al Boggess & David Arnold)
Solution manual Discrete Mathematics with Graph Theory (3rd Ed., Edgar Goodaire & Michael Parmenter)
Solution manual Essential Discrete Mathematics (Todd Feil & Joan Krone)
Solution manual Statistical Methods for the Social Sciences (4th Ed., Agresti & Finlay)
Solution manual A Brief Course in Mathematical Statistics (Tanis & Hogg)
Solution manual Business Mathematics, 10th Ed. (Miller, Salzman & Clendenen)
Solution manual Elementary Statistics (6th Ed., Weiss)
Solution manual Elementary Statistics (7th Ed., Weiss)
Solution manual Elementary Statistics (8th Ed., Weiss)
Solution manual Elementary Statistics Using the Graphing Calculator: For the TI-83/84 Plus (Mario Triola)

Solution manual Elementary Statistics Using the TI-83/84 Plus Calculator (2nd Ed., Mario Triola)
Solution manual Elementary Statistics Using the TI-83/84 Plus Calculator (3rd Ed., Mario Triola)
Solution manual Elementary Statistics Update (9th Ed., Mario Triola)
Solution manual Elementary Statistics (10th Ed., Mario Triola)
Solution manual Elementary Statistics (11th Ed., Mario Triola)
Solution manual Elementary Statistics - Technology Update (11th Ed., Mario Triola)
Solution manual Essentials of Statistics (2nd Ed., Mario Triola)
Solution manual Essentials of Statistics (3rd Ed., Mario Triola)
Solution manual Essentials of Statistics (4th Ed., Mario Triola)
Solution manual Introductory Statistics (7th Ed., Neil Weiss)
Solution manual Introductory Statistics (8th Ed., Neil Weiss)
Solution manual Introductory Statistics (9th Ed., Neil Weiss)
Solution manual Intro Stats (2nd Ed., De Veaux, Velleman & Bock)
Solution manual Intro Stats (3rd Ed., De Veaux, Velleman & Bock)
Solution manual Stats: Data and Models, (De Veaux, Velleman & Bock)
Solution manual Stats: Data and Models, (2nd Ed., De Veaux, Velleman & Bock)
Solution manual Elementary Statistics Using Excel (2nd Ed., Mario Triola)
Solution manual Elementary Statistics Using Excel (3rd Ed., Mario Triola)
Solution manual Elementary Statistics Using Excel (4th Ed., Mario Triola)
Solution manual Stats : Modeling the World (2nd Ed., Bock, Velleman & De Veaux)
Solution manual Stats : Modeling the World (3rd Ed., Bock, Velleman & De Veaux)
Solution manual Statistical Reasoning for Everyday Life (2nd Ed., Bennett, Briggs & Triola)
Solution manual Statistical Reasoning for Everyday Life (3rd Ed., Bennett, Briggs & Triola)
Solution manual Business Statistics (Triola & Franklin)
Solution manual Business Statistics (1st Ed., Sharpe, De Veaux & Velleman)
Solution manual Business Statistics (2nd Ed., Sharpe, De Veaux & Velleman)
Solution manual Business Statistics : A First Course (Sharpe, De Veaux & Velleman)
Solution manual Biostatistics for the Biological and Health Sciences with Statdisk (Marc Triola & Mario Triola)
Solution manual Biostatistics : A Guide to Design, Analysis and Discovery (2nd Ed., Ronald Forthofer, Eun Lee, Mike Hernandez)
Solution manual A Course in Probability (Neil A. Weiss)
Solution manual Probability and Statistics (3rd Ed., DeGroot & Schervish)
Solution manual Probability and Statistics (4th Ed., DeGroot & Schervish)

Solution manual Statistics for Science and Engineering (John Kinney)
Solution manual Mathematical Proofs : A Transition to Advanced Mathematics (1st Ed., Chartrand, Polimeni & Zhang)
Solution manual Mathematical Proofs : A Transition to Advanced Mathematics (2nd Ed., Chartrand, Polimeni & Zhang)
Solution manual Elementary Number Theory (5th Ed., Kenneth H. Rosen)
Solution manual History of Mathematics : Brief Version (Victor J. Katz)
Solution manual Geometry : An Investigative Approach (2nd Ed., Phares G. O'Daffer & Stanley Clemens)
Solution manual A First Course in Abstract Algebra (7th Ed., John Fraleigh)
Solution manual Complex Variables with Applications (3rd Ed., David Wunsch)
Solution manual Numerical Analysis with CD-ROM (Timothy Sauer)
Solution manual Numerical Analysis and Scientific Computation (Jeffery Leader)
Solution manual Linear Algebra and Differential Equations (Gary Peterson & James Sochacki)
Solution manual Elementary Differential Equations (2nd Ed., Werner Kohler & Lee Johnson)
Solution manual Elementary Differential Equations with Boundary Value Problems (2nd Ed., Werner Kohler & Lee Johnson)
Solution manual Fundamentals of Differential Equations (6th Ed., Kent B. Nagle, Late, Edward B. Saff & Arthur David Snider)
Solution manual Fundamentals of Differential Equations and Boundary Value Problems (4th Ed., Kent B. Nagle, Late, Edward B. Saff & Arthur David Snider)
Solution manual Linear Algebra and Its Applications with CD-ROM, Update (3rd Ed., David C. Lay)
Solution manual Introduction to Linear Algebra (5th ed., Lee W. Johnson, R. Dean Riess & Jimmy T. Arnold)
Solution manual Calculus for the Life Sciences (Marvin L. Bittinger, Neal Brand & John Quintanilla)
Solution manual Calculus with Applications for the Life Sciences (Raymond N. Greenwell, Nathan P. Ritchey & Margaret L. Lial)
Solution manual Calculus : An Integrated Approach to Functions and Their Rates of Change, Preliminary Edition (Robin J. Gottlieb)
Solution manual Calculus (9th Ed., George B. Thomas, Jr. & Ross L. Finney)
Solution manual Thomas' Calculus, Alternate Edition (9th Ed., George B. Thomas, Jr. & Ross L. Finney)
Solution manual Calculus : A Complete Course (2nd Ed., Ross L. Finney, Franklin D. Demana, Bert K. Waits & Daniel Kennedy)
Solution manual Calculus (Elgin H. Johnston & Jerry Mathews)
Solution manual Thomas' Calculus, Updated (10th Ed., George B. Thomas, Jr., Ross L. Finney, Maurice D. Weir & Frank R. Giordano)
Solution manual Thomas' Calculus (11th Ed., George B. Thomas, Jr., Maurice D. Weir, Joel D. Hass & Frank R. Giordano)
Solution manual Thomas' Calculus Early Transcendentals (11th Ed.,

George B. Thomas, Jr., Maurice D. Weir, Joel D. Hass & Frank R. Giordano)
Solution manual University Calculus (Joel D. Hass, Maurice D. Weir & George B. Thomas, Jr.)
Solution manual University Calculus : Alternate Edition (Joel D. Hass, Maurice D. Weir & George B. Thomas, Jr.)
Solution manual Thomas' Calculus, Media Upgrade (11th Ed., George B. Thomas, Jr., Maurice D. Weir & Frank R. Giordano)
Solution manual Thomas' Calculus, Early Transcendentals, Media Upgrade (11th Ed., George B. Thomas, Jr., Maurice D. Weir, Joel D. Hass & Frank R. Giordano)
Solution manual Calculus with Applications (8th Ed., Margaret L. Lial, Raymond N. Greenwell & Nathan P. Ritchey)
Solution manual Calculus with Applications, Brief Version (8th Ed., Margaret L. Lial, Raymond N. Greenwell & Nathan P. Ritchey)
Solution manual Finite Mathematics with Applications (9th Ed., Margaret L. Lial, Thomas W. Hungerford & John Holcomb)
Solution manual Finite Mathematics with Applications (10th Ed., Margaret L. Lial, Thomas W. Hungerford & John Holcomb)
Solution manual Finite Mathematics (8th Ed., Margaret L. Lial, Raymond N. Greenwell & Nathan P. Ritchey)
Solution manual Mathematics with Applications (9th Ed., Margaret L. Lial, Thomas W. Hungerford & John Holcomb)
Solution manual Mathematics with Applications (10th Ed., Margaret L. Lial, Thomas W. Hungerford & John Holcomb)
Solution manual Mathematical Ideas (10th Ed., Miller, Heeren & Hornsby)
Solution manual Mathematical Ideas (11th Ed., Miller, Heeren & Hornsby)
Solution manual Mathematical Ideas Expanded Edition (10th Ed., Miller, Heeren & Hornsby)
Solution manual Mathematical Ideas Expanded Edition (11th Ed., Miller, Heeren & Hornsby)
Solution manual Using and Understanding Mathematics: A Quantitative Reasoning Approach (3rd Ed., Bennett & Briggs)
Solution manual Using and Understanding Mathematics: A Quantitative Reasoning Approach (4th Ed., Bennett & Briggs)
Solution manual A Problem Solving Approach to Mathematics (9th Ed., Billstein, Libeskind & Lott)
Solution manual A Survey of Mathematics with Applications (7th Ed., Angel, Abbott & Runde)
Solution manual A Survey of Mathematics with Applications: Expanded Edition (7th Ed., Angel, Abbott & Runde)
Solution manual Mathematics All Around (3rd Ed., Tom Pirnot)
Solution manual Mathematics for Elementary School Teachers (3rd Ed., Phares O'Daffer, Randall Charles, Thomas Cooney, John Dossey & Jane Schielack)
Solution manual Mathematics for Elementary School Teachers (4th Ed., Phares O'Daffer, Randall Charles, Thomas Cooney, John Dossey & Jane Schielack)

Solution manual Mathematics for Elementary Teachers with Activities (Sybilla Beckmann)
Solution manual Mathematics for Elementary Teachers plus Activities Manual (2nd Ed., Sybilla Beckmann)
Solution manual A Problem Solving Approach to Mathematics for Elementary School Teachers (8th Ed., Billstein, Libeskind & Lott)
Solution manual A Problem Solving Approach to Mathematics for Elementary School Teachers (9th Ed., Billstein, Libeskind & Lott)
Solution manual A Problem Solving Approach to Mathematics for Elementary School Teachers (10th Ed., Billstein, Libeskind & Lott)
Solution manual Essentials of Using and Understanding Mathematics : A Quantitative Reasoning Approach (Jeffrey Bennett & William Briggs)
Solution manual Technical Calculus with Analytic Geometry (4th Ed., Allyn Washington)
Solution manual Basic Technical Mathematics (8th Ed., Allyn Washington)
Solution manual Basic Technical Mathematics (9th Ed., Allyn Washington)
Solution manual Basic Technical Mathematics with Calculus (8th Ed., Allyn Washington)
Solution manual Basic Technical Mathematics with Calculus (9th Ed., Allyn Washington)
Solution manual Basic Technical Mathematics with Calculus Metric Version (8th Ed., Allyn Washington)
Solution manual Introduction to Technical Mathematics (5th Ed., Washington, Triola & Reda)
Solution manual A Graphical Approach to Precalculus (4th Ed., Hornsby, Lial & Rockswold)
Solution manual A Graphical Approach to Precalculus with Limits (3rd Ed., Hornsby, Lial & Rockswold)
Solution manual A Graphical Approach to Precalculus with Limits : A Unit Circle Approach (4th Ed., Hornsby, Lial & Rockswold)
Solution manual A Graphical Approach to Precalculus with Limits : A Unit Circle Approach (5th Ed., Hornsby, Lial & Rockswold)
Solution manual Precalculus : Functions and Graphs (5th Ed., Demana, Waits, Foley & Kennedy)
Solution manual Precalculus : Graphical, Numerical, Algebraic (7th Ed., Demana, Waits, Foley & Kennedy)
Solution manual Precalculus : Graphs and Models Graphing Calculator Manual Package (3rd Ed., Bittinger, Beecher, Ellenbogen & Penna)
Solution manual Precalculus : Graphs and Models Graphing Calculator Manual Package (4th Ed., Bittinger, Beecher, Ellenbogen & Penna)
Solution manual Functioning in the Real World : A Precalculus Experience (2nd Ed., Gordon, F. Gordon, Tucker & Siegel)
Solution manual Precalculus with Modeling and Visualization (3rd Ed., Gary K. Rockswold)
Solution manual Precalculus with Modeling and Visualization (4th Ed., Gary K. Rockswold)
Solution manual Precalculus (2nd Ed., Beecher, Penna & Bittinger)
Solution manual Precalculus (3rd Ed., Beecher, Penna & Bittinger)

Solution manual Precalculus (3rd Ed., Mark Dugopolski)
Solution manual Precalculus (4th Ed., Mark Dugopolski)
Solution manual Precalculus : Functions and Graphs (2nd Ed., Mark Dugopolski)
Solution manual Precalculus : Functions and Graphs (3rd Ed., Mark Dugopolski)
Solution manual Fundamentals of Precalculus (Mark Dugopolski)
Solution manual Trigonometry (1st Ed., Mark Dugopolski)
Solution manual Trigonometry (2nd Ed., Mark Dugopolski)
Solution manual Trigonometry (3rd Ed., Mark Dugopolski)
Solution manual Trigonometry (8th Ed., Lial, Hornsby & Schneider)
Solution manual Trigonometry (9th Ed., Lial, Hornsby & Schneider)
Solution manual Trigonometry : A Circular Function Approach (Marie Aratari)
Solution manual A Graphical Approach to Algebra and Trigonometry (4th Ed., Hornsby, Lial & Rockswold)
Solution manual A Graphical Approach to Algebra and Trigonometry (5th Ed., Hornsby, Lial & Rockswold)
Solution manual Algebra and Trigonometry : Graphs and Models Graphing Calculator Manual Package (3rd Ed., Bittinger, Beecher, Ellenbogen & Penna)
Solution manual Algebra and Trigonometry (2nd Ed., Beecher, Penna & Bittinger)
Solution manual Algebra and Trigonometry (3rd Ed., Beecher, Penna & Bittinger)
Solution manual College Algebra and Trigonometry (1st Ed., J. S. Ratti & Marcus S. McWaters)
Solution manual College Algebra and Trigonometry (2nd Ed., J. S. Ratti & Marcus S. McWaters)
Solution manual College Algebra and Trigonometry (3rd Ed., Mark Dugopolski)
Solution manual College Algebra and Trigonometry (4th Ed., Mark Dugopolski)
Solution manual College Algebra and Trigonometry : A Unit Circle Approach (5th Ed., Mark Dugopolski)
Solution manual Algebra and Trigonometry with Modeling and Visualization (3rd Ed., Gary Rockswold)
Solution manual Algebra and Trigonometry with Modeling and Visualization (4th Ed., Gary Rockswold)
Solution manual College Algebra and Trigonometry (3rd Ed., Lial, Hornsby & Schneider)
Solution manual College Algebra and Trigonometry (4th Ed., Lial, Hornsby & Schneider)
Solution manual A Graphical Approach to College Algebra (4th Ed., John Hornsby, Margaret Lial & Gary Rockswold)
Solution manual A Graphical Approach to College Algebra (5th Ed., John Hornsby, Margaret Lial & Gary Rockswold)
Solution manual College Algebra : Graphs and Models Graphing Calculator Manual Package (3rd Ed., Bittinger, Beecher, Ellenbogen & Penna)

Solution manual College Algebra (J. S. Ratti & Marcus S. McWaters)
Solution manual College Algebra with Modeling and Visualization (3rd Ed., Gary Rockswold)
Solution manual College Algebra with Modeling and Visualization (4th Ed., Gary Rockswold)
Solution manual Essentials of College Algebra with Modeling and Visualization (3rd Ed., Gary Rockswold)
Solution manual Essentials of College Algebra (Lial, Hornsby & Schneider)
Solution manual Essentials of College Algebra, Alternate Edition (Lial, Hornsby & Schneider)
Solution manual Essentials of College Algebra (10th Ed., Lial, Hornsby & Schneider)
Solution manual College Algebra (3rd Ed., Mark Dugopolski)
Solution manual College Algebra (4th Ed., Mark Dugopolski)
Solution manual College Algebra (5th Ed., Mark Dugopolski)
Solution manual College Algebra in Context with Applications for the Managerial, Life, and Social Sciences (1st Ed., Ronald Harshbarger & Lisa Yocco)
Solution manual College Algebra in Context with Applications for the Managerial, Life, and Social Sciences (2nd Ed., Ronald Harshbarger & Lisa Yocco)
Solution manual College Algebra (2nd Ed., Judith Beecher, Judith Penna & Marvin Bittinger)
Solution manual College Algebra (9th Ed., Margaret Lial, John Hornsby & David Schneider)
Solution manual Essentials of Geometry for College Students (2nd Ed., Margaret Lial, Barbara Brown, Arnold Steffenson & L. Murphy Johnson)
Solution manual Algebra for College Students (5th Ed., Margaret Lial, John Hornsby & Terry McGinnis)
Solution manual Introductory and Intermediate Algebra (2nd Ed., Margaret Lial, John Hornsby & Terry McGinnis)
Solution manual Introductory and Intermediate Algebra (3rd Ed., Margaret Lial, John Hornsby & Terry McGinnis)
Solution manual Introductory and Intermediate Algebra (4th Ed., Margaret Lial, John Hornsby & Terry McGinnis)
Solution manual Beginning and Intermediate Algebra (3rd Ed., Margaret Lial, John Hornsby & Terry McGinnis)
Solution manual Beginning and Intermediate Algebra (4th Ed., Margaret Lial, John Hornsby & Terry McGinnis)
Solution manual Elementary and Intermediate Algebra (1st Ed., Tom Carson, Ellyn Gillespie & Bill Jordan)
Solution manual Elementary and Intermediate Algebra (2nd Ed., Tom Carson, Ellyn Gillespie & Bill Jordan)
Solution manual Introductory and Intermediate Algebra : A Combined Approach (2nd Ed., Marvin Bittinger & Judith Beecher)
Solution manual Introductory and Intermediate Algebra (3rd Ed., Marvin Bittinger & Judith Beecher)
Solution manual Introductory and Intermediate Algebra through Applications (2nd Ed., Geoffrey Akst & Sadie Bragg)

Solution manual Elementary and Intermediate Algebra (1st Ed., George Woodbury)
Solution manual Elementary and Intermediate Algebra (2nd Ed., George Woodbury)
Solution manual Elementary and Intermediate Algebra (2nd Ed., Mark Dugopolski)
Solution manual Elementary and Intermediate Algebra (3rd Ed., Mark Dugopolski)
Solution manual Elementary and Intermediate Algebra : Concepts and Applications (4th Ed., Marvin Bittinger, David Ellenbogen & Barbara Johnson)
Solution manual Beginning and Intermediate Algebra with Applications and Visualization (Gary Rockswold & Terry Krieger)
Solution manual Elementary and Intermediate Algebra : Graphs & Models (2nd Ed., Marvin Bittinger, David Ellenbogen & Barbara Johnson)
Solution manual Foundations of Mathematics (Marvin Bittinger & Judith Penna)
Solution manual Intermediate Algebra (9th Ed., Marvin Bittinger)
Solution manual Intermediate Algebra (10th Ed., Marvin Bittinger)
Solution manual Intermediate Algebra : Graphs & Models (2nd Ed., Marvin Bittinger, David Ellenbogen & Barbara Johnson)
Solution manual Intermediate Algebra : Graphs & Models (3rd Ed., Marvin Bittinger, David Ellenbogen & Barbara Johnson)
Solution manual Intermediate Algebra (8th Ed., Margaret Lial, John Hornsby & Terry McGinnis)
Solution manual Intermediate Algebra (9th Ed., Margaret Lial, John Hornsby & Terry McGinnis)
Solution manual Intermediate Algebra with Applications and Visualization (2nd Ed., Gary Rockswold & Terry Krieger)
Solution manual Intermediate Algebra (Tom Carson, Ellyn Gillespie & Bill Jordan)
Solution manual Intermediate Algebra (2nd Ed., Tom Carson, Ellyn Gillespie & Bill Jordan)
Solution manual Intermediate Algebra: Concepts and Applications (7th Ed., Marvin Bittinger & David Ellenbogen)
Solution manual Beginning Algebra (10th Ed., Margaret Lial, John Hornsby & Terry McGinnis)
Solution manual Prealgebra and Introductory Algebra (Marvin Bittinger & David Ellenbogen)
Solution manual Prealgebra and Introductory Algebra (2nd Ed., Marvin Bittinger & David Ellenbogen)
Solution manual Elementary Algebra (2nd Ed., Tom Carson, Ellyn Gillespie & Bill Jordan)
Solution manual Introductory Algebra (9th Ed., Marvin Bittinger)
Solution manual Introductory Algebra (10th Ed., Marvin Bittinger)
Solution manual Prealgebra and Introductory Algebra (2nd Ed., Margaret Lial, John Hornsby, Terry McGinnis & Diana Hestwood)
Solution manual Prealgebra and Introductory Algebra (3rd Ed., Margaret Lial, Diana Hestwood, John Hornsby & Terry McGinnis)
Solution manual Elementary Algebra with Early Systems of Equations

(Tom Carson & Ellyn Gillespie)
Solution manual Elementary Algebra : Concepts and Applications (6th Ed., Marvin Bittinger & David Ellenbogen)
Solution manual Elementary Algebra : Concepts and Applications (7th Ed., Marvin Bittinger & David Ellenbogen)
Solution manual Introductory Algebra (Richelle Blair)
Solution manual Introductory Algebra (8th Ed., Margaret Lial, John Hornsby & Terry McGinnis)
Solution manual Introductory Algebra (9th Ed., Margaret Lial, John Hornsby & Terry McGinnis)
Solution manual Beginning Algebra with Applications and Visualization (Gary Rockswold & Terry Krieger)
Solution manual Integrated Arithmetic and Basic Algebra (3rd Ed., Bill Jordan & William Palow)
Solution manual Introductory Algebra through Applications (Geoffrey Akst & Sadie Bragg)
Solution manual Prealgebra (3rd Ed., Margaret Lial & Diana Hestwood)
Solution manual Prealgebra (4th Ed., Margaret Lial & Diana Hestwood)
Solution manual Prealgebra (4th Ed., Marvin Bittinger & David Ellenbogen)
Solution manual Prealgebra (5th Ed., Marvin Bittinger, David Ellenbogen & Barbara Johnson)
Solution manual Prealgebra (2nd Ed., Tom Carson)
Solution manual Basic Mathematics (9th Ed., Marvin Bittinger)
Solution manual Basic Mathematics (10th Ed., Marvin Bittinger)
Solution manual Basic Mathematics Preliminary Edition (Robert Prior)
Solution manual Basic Mathematics with Early Integers (Marvin Bittinger & Judith Penna)
Solution manual Basic College Mathematics (7th Ed., Margaret Lial, Stanley Salzman & Diana Hestwood)
Solution manual Basic College Mathematics (8th Ed., Margaret Lial, Stanley Salzman & Diana Hestwood)
Solution manual Basic Mathematics through Applications (3rd Ed., Geoffrey Akst & Sadie Bragg)
Solution manual Fundamental Mathematics through Applications (3rd Ed., Geoffrey Akst & Sadie Bragg)
Solution manual Wave Motion (J. Billingham & A. C. King)
Solution manual Solving ODEs with MATLAB (L. F. Shampine, I. Gladwell & S. Thompson)
Solution manual Numerical Solution of Partial Differential Equations: An Introduction (2nd Ed., K. W. Morton & D. F. Mayers)
Solution manual Measure Theory and Filtering : Introduction and Applications (Lakhdar Aggoun & Robert J. Elliott)
Solution manual Mathematical Models in Biology : An Introduction (Elizabeth S. Allman & John A. Rhodes)
Solution manual Insurance Risk and Ruin (David C. M. Dickson)
Solution manual Data Analysis and Graphics Using R : An Example-based Approach (2nd Ed., John Maindonald & John Braun)
Solution manual Applied Optimization with MATLAB Programming (1st Ed., P. Venkataraman)

Solution manual Applied Optimization with MATLAB Programming (2nd Ed., P. Venkataraman)
Solution manual Convex Optimization (Stephen Boyd & Lieven Vandenberghe)
Solution manual Concrete Abstract Algebra : From Numbers to Gröbner Bases (Niels Lauritzen)
Solution manual A Concrete Approach to Abstract Algebra : From the Integers to the Insolvability of the Quintic (Jeffrey Bergen)
Solution manual Calculus : Concepts and Methods (Ken Binmore & Joan Davies)
Solution manual An Introduction to Partial Differential Equations (Yehuda Pinchover & Jacob Rubinstein)
Solution manual An Introduction to Ordinary Differential Equations (James C. Robinson)
Solution manual An Introduction to Mathematical Physiology and Biology (2nd Ed., J. Mazumdar)
Solution manual An Introduction to Financial Option Valuation : Mathematics, Stochastics and Computation (Desmond Higham)
Solution manual An Interactive Introduction to Mathematical Analysis (Jonathan Lewin)
Solution manual An Introduction to Mathematical Finance: Options and Other Topics (1st Ed., Sheldon M. Ross)

List of Solutions Manuals and Test Banks

---

contact me to : mattosbw1@gmail.com
mattosbw1(at)gmail.com

NOTE : "THIS SERVICE IS NOT AVAILABLE FOR : CHINA, INDIA, RUSSIA, PAKISTAN, IRAQ, IRAN, PHILIPPINES, NORTH KOREA, NEPAL, BANGLADESH, SRI LANKA, MALDIVES, BHUTAN & COLOMBIA".

If your wanted solutions manual is not in this list, also can ask me if is available (it is a partial list). Then if you need solutions manual only contact me by email.

"ARE NOT AVAILABLES BOOKS IN DIGITAL FORMAT", ONLY SOLUTIONS MANUALS AND TEST BANKS.

This same "list of titles" of texts with availables solutions manual and/or test banks is for download from :

http://www.megaupload.com/?d=ADDS77XH

I do not review the forums, just send me an email.

- Physics & Astronomy :

Solution manual Introduction to Solid State Physics (8th Ed., Charles Kittel)
Solution manual Quantum Physics (3rd Ed., Stephen Gasiorowicz)
Solution manual Fundamentals of Nuclear Reactor Physics (Elmer Lewis)
Solution manual Nuclear Energy : An Introduction to the Concepts, Systems, and Applications of Nuclear Processes (6th Ed., Raymond L. Murray)
Solution manual Fundamentals of Electromagnetics with Engineering Applications (Stuart M. Wentworth)
Solution manual Physics (7th Ed. by Paul E. Tippens)
Solution manual Physics (6th Ed., Cutnell & Johnson)
Solution manual Physics (7th Ed., Cutnell & Johnson)
Solution manual Physics (8th Ed., Cutnell & Johnson)
Solution manual Essentials of Physics (Cutnell & Johnson)
Solution manual Understanding Physics (1st Ed., Cummings, Laws, Redish & Cooney)
Solution manual Introductory Physics : Building Understanding (Jerold Touger)
Solution manual Physics Matters : An Introduction to Conceptual Physics (James Trefil & Robert Hazen)

Solution manual How Things Work : The Physics of Everyday Life (3rd Ed., Louis Bloomfield)
Solution manual An Introduction to Modern Astrophysics (2nd Ed., Bradley W. Carroll & Dale A. Ostlie)
Solution manual Foundations of Astrophysics (Barbara Ryden & Bradley Peterson)
Solution manual Physics (5th Ed., Halliday, Resnick, Krane)
Solution manual Fundamentals of Physics (6th Ed., David Halliday, Robert Resnick & Jearl Walker)
Solution manual Fundamentals of Physics (7th Ed., David Halliday, Robert Resnick & Jearl Walker)
Solution manual Fundamentals of Physics (8th Ed., David Halliday, Robert Resnick & Jearl Walker)
Solution manual Fundamentals of Physics (9th Ed., David Halliday, Robert Resnick & Jearl Walker)
Solution manual The Physics of Everyday Phenomena : A Conceptual Introduction to Physics (3rd Ed., Thomas Griffith)
Solution manual The Physics of Everyday Phenomena : A Conceptual Introduction to Physics (4th Ed., Thomas Griffith)
Solution manual The Physics of Everyday Phenomena : A Conceptual Introduction to Physics (5th Ed., Thomas Griffith)
Solution manual Physics of Everyday Phenomena : A Conceptual Introduction to Physics (6th Ed., W. Thomas Griffith & Juliet W. Brosing)
Solution manual Integrated Science (2nd Ed., Tillery et al.)
Solution manual Integrated Science (3rd Ed., Tillery et al.)
Solution manual Integrated Science (4th Ed., Tillery et al.)
Solution manual Physical Science (5th Ed., Tillery)
Solution manual Physical Science (6th Ed., Tillery)
Solution manual Physical Science (7th Ed., Tillery)
Solution manual Physical Science (8th Ed., Tillery)
Solution manual The Physical Universe (11th Ed., Konrad Krauskopf & Arthur Beiser)
Solution manual The Physical Universe (12th Ed., Konrad Krauskopf & Arthur Beiser)
Solution manual Physics of the Life Sciences (Jay Newman)
Solution manual Physics in Biology and Medicine (3rd Ed., Paul Davidovits)
Solution manual Optics (1st Ed., Ajoy Ghatak)
Solution manual Optics (4th Ed., Eugene Hecht)
Solution manual Nonlinear Optics (3rd Ed., Robert Boyd)
Solution manual Introduction to Optics (3rd Ed., Frank L Pedrotti, Leno M Pedrotti & Leno S Pedrotti)
Solution manual Principles of Physical Optics (Charles Bennett)
Solution manual Optics : Principles and Applications (Kailash Sharma)
Solution manual Continuum Electromechanics (James R. Melcher)
Solution manual Electromagnetic Noise and Quantum Optical Measurements (Hermann A. Haus)
Solution manual Matter and Interactions I : Modern Mechanics (2nd Ed., Ruth W. Chabay & Bruce A. Sherwood)

Solution manual Matter and Interactions : Volume 1 : Modern Mechanics (3rd Ed., Ruth W. Chabay & Bruce A. Sherwood)
Solution manual Matter and Interactions II : Electric and Magnetic Interactions (2nd Ed., Ruth W. Chabay & Bruce A. Sherwood)
Solution manual Matter and Interactions : Volume 2 : Electric and Magnetic Interactions (3rd Ed., Ruth W. Chabay & Bruce A. Sherwood)
Solution manual Thermal Stresses (2nd Ed., Noda, Hetnarski & Tanigawa)
Solution manual Introduction to Statistical Physics (Kerson Huang)
Solution manual Extended Irreversible Thermodynamics (3rd Ed., D. Jou, J. Casas-Vazquez & G. Lebon)
Solution manual An Introduction to Thermodynamics and Statistical Mechanics (2nd Ed, Keith Stowe)
Solution manual Equilibrium and Non-Equilibrium Statistical Thermodynamics (Michel Le Bellac, Fabrice Mortessagne & G. George Batrouni)
Solution manual Elements of Statistical Mechanics: With an Introduction to Quantum Field Theory and Numerical Simulation (Ivo Sachs & Siddhartha Sen)
Solution manual Quantum Transport (2nd Ed., Supriyo Datta)
Solution manual Ocean Waves and Oscillating Systems (Johannes Falnes)
Solution manual Statistical Mechanics (2nd Ed., R.K. Pathria)
Solution manual Quantum Mechanics (Gennaro Auletta, Mauro Fortunato & Giorgio Parisi)
Solution manual Applied Quantum Mechanics (1st Ed., A. F. J. Levi)
Solution manual Applied Quantum Mechanics (2nd Ed., A. F. J. Levi)
Solution manual Fundamentals of Quantum Mechanics (C.L. Tang)
Solution manual Astronomy : A Physical Perspective (2nd Ed., Marc L. Kutner)
Solution manual Classical Mechanics (Douglas Gregory)
Solution manual Electromagnetic Field Theory Fundamentals (2nd Ed., Singh Guru & Hiziroglu)
Solution manual Special Relativity : From Einstein to Strings (P.M. Schwarz & J.H. Schwarz)
Solution manual Gravity : An Introduction to Einstein's General Relativity (James Hartle)
Solution manual A Short Course in General Relativity (3rd Ed., James Foster & J. David Nightingale)
Solution manual Statistical Thermodynamics (Normand Laurendeau)
Solution manual Statistical Thermodynamics and Microscale Thermophysics (Van P. Carey)
Solution manual Thermal Physics (Ralph Baierlein)
Solution manual Topics in Atomic Physics (Charles E. Burkhardt, Jacob J. Leventhal)
Solution manual Foundations of Quantum Physics (Charles E. Burkhardt, Jacob J. Leventhal)
Solution manual Applied Physics (8th Ed., Dale Ewen, Ronald Nelson, Neill Schurter & Erik Gundersen)
Solution manual Applied Physics (9th Ed., Dale Ewen, Neill Schurter & Erik Gundersen)
Solution manual Analytical Mechanics (7th Ed., Grant R. Fowles, George

Cassiday)
Solution manual Orbital Mechanics for Engineering Students (1st Ed., Howard Curtis)
Solution manual Orbital Mechanics for Engineering Students (2nd Ed., Howard Curtis)
Solution manual Diagnostic Ultrasound Imaging : Inside Out (Thomas Szabo)
Solution manual Astronomy : A Beginner's Guide to the Universe (5th Ed., Eric Chaisson & Steve McMillan)
Solution manual The Cosmic Perspective (5th Ed., Jeffrey O. Bennett, Megan Donahue, Nicholas Schneider & Mark Voit)
Solution manual The Cosmic Perspective Media Update (4th Ed., Jeffrey O. Bennett, Megan Donahue, Nicholas Schneider & Mark Voit)
Solution manual The Essential Cosmic Perspective Media Update (4th Ed., Jeffrey O. Bennett, Megan Donahue, Nicholas Schneider & Mark Voit)
Solution manual The Essential Cosmic Perspective Media Update (3rd Ed., Jeffrey O. Bennett, Megan Donahue, Nicholas Schneider & Mark Voit)
Solution manual The Essential Cosmic Perspective (3rd Ed., Jeffrey O. Bennett, Megan Donahue, Nicholas Schneider & Mark Voit)
Solution manual Astronomy Today (5th Ed., Eric Chaisson & Steve McMillan)
Solution manual Astronomy Today (6th Ed., Eric Chaisson & Steve McMillan)
Solution manual Conceptual Physical Science (3rd Ed., Paul G. Hewitt, John A. Suchocki & Leslie Hewitt)
Solution manual Conceptual Physical Science (4th Ed., Paul G. Hewitt, John A. Suchocki & Leslie Hewitt)
Solution manual Conceptual Integrated Science (Paul G. Hewitt, Suzanne Lyons, John A. Suchocki & Jennifer Yeh)
Solution manual Physics : Concepts & Connections (4th Ed., Art Hobson)
Solution manual Physics : Concepts & Connections (5th Ed., Art Hobson)
Solution manual Conceptual Physics (10th Ed., Paul Hewitt)
Solution manual Conceptual Physics (11th Ed., Paul Hewitt)
Solution manual Conceptual Physics Fundamentals (Paul G. Hewitt)
Solution manual College Physics (6th Ed., Jerry Wilson, Anthony Buffa & Bo Lou)
Solution manual College Physics (7th Ed., Jerry Wilson, Anthony Buffa & Bo Lou)
Solution manual College Physics (8th Ed., Young & Geller)
Solution manual Modern Physics (2nd Ed., Randy Harris)
Solution manual Modern Physics for Scientists and Engineers (John Morrison)
Solution manual Solid State Physics : Essential Concepts (David Snoke)
Solution manual Physics with Mastering Physics (3rd Ed., James Walker)
Solution manual Physics with Mastering Physics (4th Ed., James Walker)
Solution manual Active Learning Guide (Alan Van Heuvelen & Eugenia Etkina)
Solution manual E&M TIPERs : Electricity & Magnetism Tasks (C. J.

Hieggelke, D. P. Maloney, T. L. O'Kuma & Steve Kanim)
Solution manual Physics : Principles with Applications (6th Ed., Douglas C. Giancoli)
Solution manual Physlet® Physics : Interactive Illustrations, Explorations and Problems for Introductory Physics (Wolfgang Christian & Mario Belloni)
Solution manual University Physics with Modern Physics with Mastering Physics (11th Ed., Hugh Young & Roger Freedman)
Solution manual University Physics with Modern Physics with Mastering Physics (12th Ed., Hugh Young & Roger Freedman)
Solution manual Physics for Scientists and Engineers (3rd Ed., Douglas C. Giancoli)
Solution manual Physics for Scientists and Engineers with Modern Physics (3rd Ed., Douglas Giancoli)
Solution manual Physics for Scientists and Engineers with Modern Physics (4th Ed., Douglas Giancoli)
Solution manual Physlet® Quantum Physics : An Interactive Introduction (Mario Belloni, Wolfgang Christian & Anne Cox)
Solution manual Introduction to Electrodynamics (3rd Ed., David J. Griffiths)
Solution manual Introduction to Quantum Mechanics (2nd Ed., David Griffiths)
Solution manual Quantum Mechanics : An Accessible Introduction (Robert Scherrer)
Solution manual Modern Quantum Mechanics (J. J. Sakurai)
Solution manual The Physics of Sound (3rd Ed., Richard Berg & David Stork)
Solution manual Electromagnetism : Principles and Applications (1st Ed., Paul Lorrain, Dale R. Corson)
Solution manual Classical Electromagnetism (Jerrold Franklin)
Solution manual Classical Electrodynamics (2nd Ed., John David Jackson)
Solution manual Nanoengineering of Structural, Functional and Smart Materials (Mark Schulz, Ajit Kelkar, Mannur Sundaresan)
Solution manual Introduction to Color Imaging Science (Hsien-Che Lee)
Solution manual An Introduction to Astrobiology (Iain Gilmour & Mark Sephton)
Solution manual An Introduction to Galaxies and Cosmology (Mark HJones & Robert Lambourne)
Solution manual An Introduction to the Solar System (Neil McBride & Iain Gilmour)
Solution manual Quantum Physics (Michel Le Bellac)
Solution manual Laser Fundamentals (2nd Ed., William T. Silfvast)
Solution manual Laser Electronics (3rd Ed., Joseph T. Verdeyen)
Solution manual Introductory Quantum Optics (Christopher Gerry & Peter Knight)
Solution manual Introduction to Plasma Physics: With Space and Laboratory Applications (D. A. Gurnett & A. Bhattacharjee)
Solution manual A Short Introduction to Quantum Information and Quantum Computation (Michel Le Bellac)

Solution manual A Quantum Approach to Condensed Matter Physics (Philip L. Taylor & Olle Heinonen)
Solution manual A First Course in String Theory (Barton Zwiebach)
Solution manual A First Course in Computational Physics and Object-Oriented Programming with C++ (David Yevick)
Solution manual A Course in Modern Mathematical Physics : Groups, Hilbert Space and Differential Geometry (Peter Szekeres)
Solution manual Ultrasonic Nondestructive Evaluation Systems: Models and Measurements (Lester W. Schmerr & Sung-Jin Song)
Solution manual Explorations : Stars Galaxies and Planets (1st Ed. Updated, Thomas Arny)
Solution manual Explorations : An Introduction to Astronomy (2nd Ed., Thomas Arny)
Solution manual Explorations : An Introduction to Astronomy (3rd Ed. Updated, Thomas Arny)
Solution manual Explorations : An Introduction to Astronomy (4th Ed. Updated, Thomas Arny)
Solution manual Explorations : An Introduction to Astronomy (5th Ed. Updated, Thomas Arny)
Solution manual Astronomy : Journey to the Cosmic Frontier (3rd Ed., John D. Fix)
Solution manual Astronomy : Journey to the Cosmic Frontier (4th Ed., John D. Fix)
Solution manual Astronomy : Journey to the Cosmic Frontier (5th Ed., John D. Fix)
Solution manual Pathways to Astronomy with Starry Night Pro (Steven Schneider & Thomas T Arny)
Solution manual From Molecules to Networks (2nd Ed., John Byrne & James Roberts)
Solution manual Biotechnology (David Clark & Nanette Pazdernik)
Solution manual Light and Video Microscopy (Randy Wayne)

It would just be a guess on their part. Like one said, it
will depend mostly on the height in wavelength for the band
being used at the time.
The easiest way to get a good guess would be to
d/l one of the modeling programs and model a 3 el
yagi for each of the bands. That will get you close
enough for gov work. The type of yagi being modeled
doesn't really matter, so there is no real need to
exactly duplicate a A3S.. Just one of the regular
included yagi models will do..

The speed of light is media dependent.

The media may or may not have characteristics that are frequency dependent.

I think the difference might be in gain, not directivity...
The IR losses in the conductors (and components) would be different in a helically loaded monopole and a lumped network matching a short unloaded monopole. One could probably construct examples for cases where either one has lower loss.

There might also be a difference in the losses in the ground plane, although, intuitively, I suspect they would be small. The current distribution just isn't that different between the two cases

It would be interesting to run some cases where you use "wire" (1cm diameter conductors on your helix are pretty big... I'd try something like 1mm (18 AWG) or maybe 2mm (12 AWG)..

As I recall, NEC does figure out the losses accounting for skin effect, etc., although it might not deal with the "proximity effect" from adjacent turns.

Depends what you mean by "space".. perfect vacuum, sure..

But what's between the planets in the Solar System isn't a perfect vacuum, and so, it shows dispersion due to the presence of small amounts of ionization.

Granted, it's generally a better vacuum than you are likely to achieve on Earth by mechanical means.

670. Antenna Modification Advice

Newsgroup: rec.radio.amateur.antenna
Date: 2011-03-28 18:29:25 UTC
From: Tom Horne <hornetd@gmail.com>
Message-ID: <9da0aabd-c737-4fd8-91a0-26e70fc024f4@j9g2000prj.googlegroups.com>
Source record: 5320

I built a so called "Super J-pole" which is really two stacked
collinear half
wave antennas with a quarter wave phasing stub between them. The
design is by
N7QVC and it can be seen at <http://www.n7qvc.com/amateur_radio/
copper.html>. I
also placed a photograph of a representative build in the photo
section of this
reflector at
<http://groups.yahoo.com/group/amateur_radio/photos/album/1449680574/
pic/3362107\
0/view?picmode=&mode=tn&order=ordinal&start=1&count=20&dir=asc>.

I have had good results with this antenna but I wanted to make it into
a dual
band antenna that would work on seventy centimeters as well as on two
meters. I
was wondering if I could use a technique developed by Edison Fong,
WB6IQN on
this antenna in the same way he used it on an ordinary single half
wave J-pole.
What he did is to place an open quarter wave stub at the top of the
two half
wave lengths for seventy centimeters. That stub limits the UHF signal
to the
two half waves length at UHF of the antenna. It seems like it would
work from
having read his paper on the combination two meter and seventy
centimeter J-pole
antenna. That would give the antenna the same gain on seventy
centimeters as a
J-pole that is just for that band. For reference I have placed WB6IQNs
paper in
the files section of the newsgroup at
<http://f1.grp.yahoofs.com/v1/
kL6QTZLk1DQjM_Cn3vuvnsLUIuEsvRHSqUZyX2mw294a7mYKkc\
FBIXXlRY_6QxreqNWVpn0b7Dogiw9LafU63W429yoO/DBJ2_port_art.pdf>.

My first question is does anyone see any reason why this would not
work?

My second question is how would I construct the stub into a copper J-
pole.
Since WB6IQNs J-pole is a wire antenna, with or without a plastic
radome, he

used a piece of Coaxial cable as part of his two meter wire with the shield at
the end of the seventy centimeter portion of the antenna shorted to the two
meter radiator and the bottom of the shield, which is a quarter wave at UHF
below the top of the UHF segment, open relative to the two meter radiator.
Could I just use a full quarter wave stub made from a copper T, a street L, and
a short length of copper pipe turned back down along the two meter radiator? (A
street L is a ninety degree bend formed to allow it to be close coupled to an
adjacent fitting without a pipe nipple in between.)

My third question is if instead of shortening the lower VHF half wave
electrically to a UHF length I found a way to short out the quarter wave phasing
stub between the two VHF half wave radiators to UHF signals thus giving UHF
signals three full wave lengths of radiator to use would the gain be worth the
effort. To provide the shunting of the VHF quarter wave phasing stub I was
GUESSING that a half wave UHF coupling stub might work.

I freely admit to being out of my depth; or as a mariner might say off my
soundings; here. So I'm fully prepared to hear that the UHF half wave coupling
stub would not work as a shunt for the UHF signals to get past the VHF quarter
wave phasing stub. I have no pretense to any expertise. I'm trying to learn.
Laugh all you want but if it won't work please tell me in neophyte decipherable
language why not. If you have any guidance to offer it would be most welcome
but please keep the fog index down to the degree you are able. Thank you in
advance.

Speed of waves in a dispersive medium is temperature dependent.
In the Solar System the temperatures are decreasing with the distance from
the Sun.

You have send us: http://ipnpr.jpl.nasa.gov/progress_report/42-65/65I.PDF

It seems to me that the no answer for Maxwell's question:
"Incidentally, Maxwell once suggested that Roemer's method could be used to
test for the isotropy of light speed, i.e., to test whether the speed of
light is the same in all directions. Roemer's method can be regarded as a
means of measuring the speed of light in the direction from Jupiter to the
Earth. Jupiter has an orbital period of about 12 years, so if we use
Roemer's method to evaluate the speed of light several times over a 12 year
period, we will be evaluating the speed in all possible directions (in the
plane of the ecliptic). "

Do you know the answer?

Here are the base feedpoint impedances for that NEC model
of a helix for the suggested conductor diameters...

1mm = 0.12 -j 2260 ohms
2mm = 0.12 -j 2170 ohms

Somehow, I think there is a difference. I think that they are being shown to be the same in the computer model is not valid in the real world. That said, in real world use, the differences do seem to be insignificant.

And, that said, I use a helical wound, half-wave electrical length - quarter-wave physical length, monopole in lieu of a 1/4 wave physical-length and physical length antenna. And, in personal experience, this DOES provide increased performance over the 1/4 wave.

In most real world restrictions, the helical wound versions always are an advantage in real world physical size ...

Hello Dave,

If you have a directional antenna (take a Yagi) and you look to the back of the antenna (so you look in the direction of wave propagation), the E-veld vector moves in the same plane as the plane of the antenna.

When you take two of this antenna's, one vertical and one horizontal and feed them 90 degr out of time phase (same power to each antenna), the E-field vector will rotate when it passes a fixed reference plane. Depending on + or − 90degr phase difference, the vector will rotate clockwise (RHC) or counter-clockwise (LHC).

Now take two of these circular antennas (for example both RHC). Now make one of the antennas the receive antenna. To do this, you have to rotate the antenna around its vertical axis over 180 degr. (so they look towards each other). This flips the horizontal yagi (causing 180 degrees phase shift in the horizontal path), but the vertical yagi does not flip.

This 180 degrees phase shift in the horizontal path is the reason that total phase shift for both vertical pol. as well as horizontal pol. paths are in phase.

So for line of sight, and you use circular polarized antennas, you need two antennas with same sense. In case of a single reflection on a perfect conductor, you need to change the sense of one of the antennas. The reason for that is that the horizontal part of the circular antenna isn't flipped and both hor. and vert. polarized reflections experience 180 degr. phase shift.

For non-perfect materials: when the angle of incidence is far below the (pseudo) Brewster angle, you need antennas with opposite sense. When far above the Brewster angle (so small grazing angle), the antennas should have same sense for best results (if you want to use the reflection path).

At the (pseudo) Brewster angle, you lose most of the vertical polarized component (parallel polarized component in physics) when the media interface is in the horizontal plane. So the receive antenna sees a mostly linear polarized (horizontal) component. In practice this component may interfere with the direct path.

Only for moon bounce.

For one antenna direct to another, they must both be the same. That would be RHC for both antennas or LHC for both antennas. If one is LHC and the other is RHC, there is about a 20 or so db difference, just as it would be going horizontal to vertical. If the signal bounces off something ONE time, then it is reversed.

There are other things that may cause the signal to be reversed or atleast be stronger if reversed. There are cases where the OSCAR signal will be stronger if the opposite sense is used. Sometimes while using a circular antenna (KLM22C) I have found earth station that use horizontal or vertical antennas stronger one way than the other.

Unlike the original example, that would produce a quite different
current distribution on the antenna. I suspect the half-wave helical
wouldn't require as good a radial system as the standard 1/4WL
monopole since the current maximum point is halfway up the helical.
Did you end-feed the beast or center-feed it? Did you have a good
radial system?

Maybe.. depends on the medium, I should think, and the mechanism of the
dispersion. Some dispersion might be due to ionization (which may or
may not be temperature dependent).

> In the Solar System the temperatures are decreasing with the distance from
> the Sun.

Temperature in a vacuum and with ionized particles is tricky to define.
It has to do with mean free path and the velocity of the particles.
When the number density gets down in the "few atoms per cubic meter" and
the mean free path gets to be meters or km, I think you need to start
thinking in different ways.

One common confusion is an assumption of a particular velocity
distribution in charged particles and then using the 11000K = 1 eV relation.

Quoting from Antenna Engineering Handbook, 2nd Edition by Johnson and Jasik, page 13-18: "For a normal-mode helix whose dimensions are small compared to a wavelength, the current distribution along the helix is approximately sinusoidal."

John Kraus also assumed sinusoidal current distribution along the helix in his Fig 8-72 (see clip).

This current sinusoid exists along the aperture of the helix, and not along the spiral conductor itself. Therefore it is unclear as to the source of this belief that current would be maximum at the center of "1/2-WL" helix whose end-end length is 1/4-WL. In reality the current maximum would be at the base of the radiator, just as it is for a 1/4-wave linear monopole.

The current distribution along the aperture of both of these forms of radiators has a sinusoidal shape. The current at the top of both of these radiators must be zero. The portion of a sinusoidal waveform at the operating frequency, beginning with zero current at the top, that can exist along the aperture of radiators that are physically short in terms of wavelength, as in my NEC comparison, appears to be a straight line with zero current at the top and maximum current at the base of the radiator.

With essentially identical current distribution along the aperture of both radiator forms, it should be expected that the helix and linear monopoles in this discussion should have essentially identical radiation resistances and patterns.

This has been shown to be true in the NEC comparison in the OP, and is supported by the quoted statements from well-respected authors of antenna engineering textbooks.

Yes. This is shown in various editions of the ARRL Antenna Handbook and
the ARRL Handbook itself.

The next step would be to run it plugging in some reasonable number for the wire resistivity. The patterns should be quite similar. I theorize that it will show that for same power in at the feedpoint, the "gain" will be slightly less for the helically loaded one (because there's a longer wire, so more resistance, for essentially the same current distribution in the wire).

Then, the question would be whether the helically loaded unit has a lower loss in a matching network at the base.

Hi Tom,

After looking at the mile long URL to one of your offerings - I would like to see the fog lift too.

Why don't you simply tell us what performance you want to achieve from an antenna?

A simple quarterwave antenna built on a SO-239 connector with four drooping radials is squat simple, cheap, and can be built and trimmed to near perfect match in half an hour or less. You want multiband? Make two vertical, slightly skewed elements (each cut for the suited band) joined at the feedpoint. You want more gain? How much more? Build two or (n-times) more and spend your effort in learning to construct feedline systems to additively join them.

But John, a helix that is 180 degrees long electrically is not small.
It is electrically double the size of a 1/4WL monopole.

Not true. Any monopole that is electrically 180 degrees long will have
the current maximum point in the middle and a normal mode helix is no
exception. You can easily model such with EZNEC. For any 180 degree
antenna, at the feedpoint, the reflected voltage will arrive in phase
with the forward voltage. The reflected current will arrive 180
degrees out of phase with the forward current.

Zfp = (Vfor+Vref)/(Ifor-Iref) is a current minimum

Take your NEC helical model and adjust the frequency to approximately
double the resonant frequency and take a look at the current
distribution.

I have already done an illustration based on the currents in the NEC comparison posted earlier, showing a helix and a linear monopole each about 6 degrees in aperture (link below).

This link shows that even though the length of wire used in the helix is 3.14 X the length used in the linear monopole, the current distribution along their apertures essentially is the same, as will be the directivity and radiation pattern of both versions.

This same equivalence would apply to the current distribution, directivity and pattern of a linear, 1/4-WL monopole and a helically-wound monopole that was 1/4-WL in aperture, but contained 1/2-WL of coiled wire.

"small" in Kraus's book means "physically" small, not electrically small.

This is no different than taking the "non-helical" antenna and feeding
it at twice the frequency.

I would imagine that the pattern of the helically loaded and the
unloaded will be quite similar at ANY frequency, until you get to where
the *diameter* of the assembly starts to be a significant fraction of a
wavelength.

What might change more is the resistive losses, although I suspect
they'll scale in proportion too. Whether you've strung 10 meters, 20
meters or 30 meters of wire in a physical 10 meter length doesn't change
the *radiation* properties a huge amount.

How about Ordinary and Extraordinary rays in the dispersive medium of
the ionosphere. Is the ionosphere "vacuum" enough for you? The space
station orbits in the middle of it, and most folks think that qualifies
as vacuum (1e-6 Torr, or so). Electron density runs pretty high: about
1E10-1E12/m3

At the top, the pressure runs about 1E-5 Pascal (7.5E-8 torr) & mean
free path is on the order of tens of km.

There's lots and lots and lots of data about dispersion of EM
propagation in the ionosphere.

Again, I'm not sure "temperature" is the relevant measure for something like that. You can define temperature for a very low pressure gas like this, but it's not in the same sort of sense as one would apply to a bulk tangible medium (like air at the Earth's surface or water)

Richard
I wanted to explore whether it is practical to have my collinear dual half wave J-pole serve as a dual band antenna. If it were practical I would want the same gain on seventy centimeters that I have been getting out of the dual stacked half wave on two meters. The available testing that I was able to find says that it is 6 DB over a quarter wave vertical. What I would happily settle for would be for it to have the same gain on seventy centimeters as the dual band simple J-pole I am using now. After talking to Rol Anders, K3RA; who was the instructor for my Extra theory class and is the present chairman of the Question Pool Committee of the National Council of Volunteer Examiner Coordinators (NCVEC); last night I am taking that later approach. That is the approach that I outlined in the first paragraph of just putting an open blocking stub for UHF at thirty five centimeters ~ up the lower two meter half wave and therefore below the two meter phasing stub between the two meter half wave segments. That has the virtue of being simple and still giving me a dual band antenna that has better gain on UHF then the unmodified two meter antenna would.

I wanted a dual band antenna because I only have three suitable mounting points on my home and I already have plans for a six meter J-pole and an anemometer / sensor array assembly on the other two. I have an Arrow dual band J-pole up on that mounting point right now but I wanted to return to the higher gain of the collinear dual half wave J-pole that gave me so much better real world performance on two meters. It is my hope that just adding the seventy centimeter band blocking stub to the collinear antenna's lower two meter half wave segment will do the trick.

Isaac Asimov touched on this in his book on physics. He said the
temperature up there is high because of the high molecule velocity, but
that *heat* is another matter. So, you can have a high "temperature"
even if the "heat" is practically nil.

That makes you correct. One must carefully state what is meant by
temperature and what is meant by heat.

What we have here is a failure to communicate. Please forget about
your previous posting. We are not talking about 6 deg. electrically
short helicals. We are talking about comparing an 180 degree
electrically long monopole to a 90 degree long RESONANT monopole.
Here's how to accomplish what we are talking about:

1. Wind a helical that is 90 degrees long, i.e. the feedpoint
impedance is R1+j0. That helical is 1/4WL long electrically and
resonant. It may be ~1/8WL (45 deg) long physically.
2. Now increase the frequency until the helical is 180 degrees long
electrically. At something like double the frequency, it will be 1/2WL
long electrically and the feedpoint impedance will be R2+j0 where
R2>>R1. It may be ~1/4WL long physically.

John said his 180 degree helical outperformed his resonant 90 degree
helical. His statement has nothing to do with electrically short
helical monopoles because they are resonant.

The current maximum for a 90 degree resonant helical will be at the
base feedpoint just as it is for a 90 degree stub. The current maximum
for a 180 degree helical will be halfway up the antenna just as it is
halfway up a 180 degree stub.

A helical longer than a few degrees will exhibit transmission line
effects. A helical that is electrically 180 degrees long will have
essentially the same standing wave current envelope as a 180 degree
long open-circuit transmission line stub. EZNEC agrees.

John said his 180 degree electrically long helical outperformed his
electrically long 90 degree helical. The standing-wave current
envelope for the 90 degree helical is a cosine with the current
maximum at the feedpoint. The standing-wave current envelope for the
180 degree long helical is a sine wave with the current maximum point
in the middle of the helical. They would not have the same radiation
patterns. EZNEC agrees.

Again, I have modeled these conditions using EZNEC and I am reporting
the results. The "Currents" button will give the current magnitude/
phase for each segment in the helical.

That is true ONLY if the end-to-end length (height) of a normal-mode helical monopole occupies about 180 degrees of a free-space wavelength.

If that helix occupies only about 90 degrees of a free-space wavelength, then no matter how much linear wire length is contained in the coils of the helix, that helical radiator will have the radiation resistance, pattern and directivity characteristics of a 90-degree linear monopole of the same end-to-end height.

The length of coiled wire in a helix of any physical length makes very little difference in the current distribution along its aperture, its directivity, or its radiation patterns.

Hi Tom,

It is extremely hard to accept claims for J-Poles when nothing is said
about the care in choking the feed point, and further choking the
section of line a quarter wave away from the feed point.

Typically this discussion is arrived at with some surprise on the part
of the J-Pole user who posts here (I know you have participated here
before, and are thus not a newbie). Some (which means too many)
respond that choking is unnecessary. They are satisfied with its
performance (never daring to examine that it could be vastly
improved).

We also have writers here who condemn the J-Pole vehemently in equal
measure. They, too, have not examined the necessity of choking and
they suffer from the knowledge that things could be vastly improved.

This is the pitiable lament of feeding halfwave elements in any form.

Let's examine what you call "available testing." I presume this means
in software, and not in the lab (never mind alternatives such as out
in a field). I could be wrong and you may correct this on your
response.

However, moving on with whatever presumption, the reason why choking
is important is that with High Z antennas, they tend to drive the
transmission line into radiation. This extends the length of the
radiator, and too often this raises the lobe of maximum radiation up
into the sky (you are very near that with the half wave where 5/8ths
is considered the limit of physical height before this trips over).

These are all issues related to a vertical, and its elevation goes into the mix too to further confuse comparisons.

Now, basically you are asking the same antenna to operate at roughly triple the frequency. This also means either element of the native radiator will stand like something under 3/2 wavelengths tall - truly a cloud burner (not good).

You speak of stubs to fix this. You would have to start with two 3/2 halfwave radiators, one over the other. Fixing the phase for both 2M and 440 would be a miracle in achievement. I presume you would also trap the individual 3/2 wave length sections into two 5/8ths (but the ratios don't quite work out that way); or three half waves; or six quarter waves - and then do it again for the section above. Whew!

This is a monumental task - but you have simpler goals as the following would suggest:

>just putting an open blocking stub for UHF at thirty five
>centimeters ~ up the lower two meter half wave and therefore below the
>two meter phasing stub between the two meter half wave segments. That
>has the virtue of being simple and still giving me a dual band antenna
>that has better gain on UHF then the unmodified two meter antenna
>would.

The blocking stub I presume you to mean a trap for 440. It is going to upset the matching stub between the two halfwave 2M elements. Here you will have to juggle between tuning them both on each band.

It is less than monumental, but still quite a job, and one that demands that you cut and try and fully erecting your last attempt to see how it works (doing this on the ground is going to lead to grief - especially if you ignore proper choking).

P.S.

Both linear, and helical normal-mode monopoles of ~6 degrees physical aperture (and less) can be made resonant at the operating frequency via a suitable inductance placed either in the monopole itself, or at its feedpoint.

But resonance so achieved does NOT mean that such monopole radiators will have a very useful amount of radiation resistance, or that such a resonant condition equates to the performance of a radiator that is resonant without the need for such an additional inductance.

This reality appears to have been overlooked in some of the earlier posts in this thread.

I suppose, too, that the whole things still works in terms of, say, propagation velocity of sound, because that is driven by velocity of molecules/atoms (and is related to square root of Temperature).

So, sound propagates very quickly in the ionosphere (it's got a fairly high temperature), but because there's not a whole lot of atoms around, the attenuation will be quite high (essentially infinite, I suspect)

And that's totally different than propagating something by EM waves.

I just modeled a 5.25' long helical using EZNEC at the 270 degree 3rd harmonic frequency of 26.5 MHz. Both helical and whip are modeled as lossless.

If I understand you correctly, the 270 degree helical should have a TOA equal to a 5.25' whip. The TOAs differ by 6 degrees. The maximum gain of the 5.25' whip is -0.25 dBi. The maximum gain of the 270 degree helical of the same length is +0.29 dBi, a difference of 0.54 dB.

The 5.25' whip is1/4WL resonant at 45.3 MHz with a maximum gain of -0.25 dBi at a TOA of 27 degrees. The 5.25' helical at 45.3 MHz has a gain of -3.13 dBi at a TOA of 24 degrees, a difference of 2.88 dBi and 3 degrees.

Faraday supposed that this apply to the electric waves. Of course there the
electrons vibrate. The relation to temperature of electrons would be easy to
measure.
>

No. Acoustic waves from the Sun (aurora) are et the Earth quite strong.
>
> And that's totally different than propagating something by EM waves.

Electric waves propagate in metal and in space. In the both media the
electrons vibrate. "I suppose we may compare together the matter of the
aether and ordinary matter (as, for instance, the copper of the wire through
which the electricity is conducted), and consider them as alike in their
essential constitution"(Faraday).
>

It would be easy after Schmidt's experiment in vacuum. There the hot cylider
in air bends the light rays and the shadow diameter is bigger than for the
cold cylinder.

The same experiment in vacuum tell us if speed of light is electrons temperature dependent.
S*

A normal-mode helical with a radiating aperture of 5.25' is not a "270
degree" radiator on 26.5 MHz. It is a ~ 51 degree radiator on that
frequency.

This is making no sense to me so I fear we have some sort of semantic problem. I'm now not sure what you mean by "a radiating aperture of 5.25 feet". "The IEEE Dictionary" says: "In some cases, the aperture may be considered to be a line." I was assuming that the 5.25 feet aperture was akin to a line of straight wire 5.25 feet long or a 5.25 foot long (end to end) helical monopole. If that is not the case, please enlighten me on your definition of "aperture". EZNEC says my 5.25' (end-to-end) physically tall helical monopole is electrically 270 degrees long.

I assumed that 5.25' is the length of a straight wire or the physical end-to-end length of the helix itself (not the linear length of the wire). The velocity factor of a helix is a function of the helix geometry and *varies widely with diameter and turn spacing*. The helix I designed using EZNEC has a current maximum at the feedpoint, a current minimum 1/3 of the distance up the helix, a current maximum 2/3 of the distance up the helix, and a current minimum at the end of the helix. That's 270 electrical degrees any way you cut it because *there is always 90 electrical degrees between the current maximum and current minimum in a standing wave*.

The requirement that a 5.25' tall helical monopole has to satisfy to be 270 electrical degrees long on 26.5 MHz is to have a velocity factor of 5.25/27.85 = 0.1885 which is a piece of cake. The 5.25' is the actual end-to-end height of the helical monopole and the 27.85' is 3/4 of a wavelength in free space at 26.5 MHz.

Note that the velocity factor is the distance a traveling wave travels in the helical medium in unit time compared to the distance a traveling wave travels in free space in the same unit time.

Richard, this is giving me a headache - what am I missing?

Sorry, I just noticed you are talking about physical length rather
than electrical length. Do you agree that the helical is 270 degrees
long *electrically* because there are two current maximum points and
two current minimum points on the helical antenna that is 5.25 feet
long?

FP-Imax-////////////////////-Imin-////////////////////-
Imax-////////////////////-Imin

The Imax points are 3.5 feet apart. They are not very far apart
compared to wavelength (~0.1WL) but they are far enough apart to raise
the take-off-angle by 6 degrees for my particular helical according to
EZNEC. With everything else being equal, when a 5.25 foot helical
antenna has more than one current maximum point on the antenna, it
will raise the take-off-angle by an amount correlated to the
percentage of a wavelength spacing between the two current maximum
points.

Conclusion: What you have said seems to be a fact for antennas with
only one current maximum. The presence of two (or more) current
maximum points on the antenna modifies the take-off-angle according to
the laws of radiation physics which is demonstrated by NEC using the
method-of-moments algorithms. A 5.25' end-to-end helical is not the
same as a "~51 degrees radiator on 26.5 MHz" when it has two (or more)
current maximum points separated by, e.g. 0.1WL. The two take-off-
angles are 20% different just as they should be.

http://www.arrowantenna.info/osj/j-pole.html

This design works moderately well. Drive the 19.25 inch element. The
51 inch element is the radiator on 2m, the 6.xx inch element makes the
19.25 inch one radiate on 440. The thing isn't great on 440 because the
51 inch portion is there. It is rugged though.

I built a duplicate, which you can do if you look at all the parts pages
on the site. The main problem, same as all J poles, is common mode
current issues on the feedline.

Cecil -

The link below shows the NEC-2D results for the 3-m monopole whose geometry I posted earlier -- at its frequency of first self-resonance, and at 3X that frequency.

We don't disagree as far as current distribution is concerned, but maybe in the belief that such a helix at an operating frequency that is 3X its first resonance has a practical benefit for users.

The reason that it may not is traceable to the radiation resistances at each frequency w.r.t. a fixed amount of antenna system loss.

I'm not saying that it has a benefit - just that a 270 degree
electrically long antenna can never have the same radiation pattern as
a 51 degree physical whip even if the physical length of the 270
degree helical antenna is physically 51 degrees.

To be clear on what I am saying: Up to a certain percentage of a
wavelength, the physical length of the antenna dictates the radiation
pattern. Above that percentage of a wavelength, the theory falls
apart.

It is akin to assuming that the current distribution in the top
portion of a monopole is a straight line. At some point, the straight
line assumption fails because the current distribution is actually
sinusoidal.

Hi Tom,

Your suggestion would have been my choice too - except for Tom's first purchase choice. The open stub has always seemed to be a more natural feed method.

The addition of the parasitic radiator is still an option for any design.

Posting-Frequency: posted monthly
URL: http://www.panix.com/~rram/usenet/rram/index.html

Changes followed by "|".

After a 30-day public discussion and feedback period to gauge reader
opinions in March of 2009:

http://groups.google.com/group/rec.radio.amateur.moderated/browse_thread/thread/d7d337db35
f23326

the rec.radio.amateur.moderated Moderation Team has decided to consider
amending its charter, and permit limited simultaneous crossposting to
rec.radio.amateur.moderated and one other unmoderated
amateur-radio-related discussion newsgroup. We are currently trying
this on a temporary basis (90 days, through early July 2009), and adopt
it permanently if successful.

Approved rec.radio.amateur.* newsgroups are those that are currently
listed in the latest version of the "List of Big Eight Newsgroups" which
is crossposted monthly to news.announce.newgroups, news.groups, and
news.lists.misc.

Approved alt.radio.amateur.* and alt.ham-radio.* newsgroups are those
that have been created consistent with the suggestions in "So You Want
to Create an Alt Newsgroup" at:

http://www.faqs.org/faqs/alt-creation-guide/

Approved regional hierarchy newsgroups are those that contain either
"radio.amateur" or "ham-radio" in their names, including
uk.radio.amateur and aus.radio.amateur.misc.

We will make every reasonable effort to keep our list of approved
newsgroups up-to-date. In case we have overlooked any, and a submission
is rejected in error as a result, the rejected submitter can E-mail us
at our administrative contact address (in the signature at the bottom of
this article, and the default Reply-To for the rejection message)
requesting that it be added, and that the article be approved. We may
still choose to reject articles crossposted to any alt.* newsgroup with
an inappropriate name, including obscene language, embedded
name-calling, or encouragement of unlawful conduct.

> Do you have an EZnec file you can post? I'd like to see what you're doing.

It is at:

http://www.w5dxp.com/helix.EZ

The 90 degree (1/4WL) resonant frequency is 10.067 MHz where the TOA
is 150 degrees.

The 270 degree (3/4WL) resonant frequency is 26.493 MHz where the TOA
is 155 degrees.

The difference in TOA is because of the two current maximum points at
26.493 MHz.

The 180 degree (1/2WL) resonant frequency is 16.6254 MHz where the TOA
is 29 degrees. Raising the single current maximum point from the
feedpoint to the midpoint of the helical monopole only moves it by
2.625 feet which is 0.0444WL (16 physical degrees) and that lowers the
TOA by one degree. Since the 1/2WL helical contains twice as much
wire as the 1/4WL helical, I don't see any advantage for the 1/2WL
helical over the 1/4WL helical except for the elevated current maximum
point which may require a less robust radial system.

The "Currents" button on EZNEC will display the current magnitude/
phase in the helical segments.

I just modeled the 1/4WL helical vs the 1/2WL helical with 4 elevated
radials and copper wire losses. The 1/2WL helical gain is 1.23 dB
higher than the 1/4WL helical gain and the TOA is 2 degrees lower for
the 1/2WL version.

Hello Cecil, for me the radial / counterpoise issue is a big advantage
of electrically (near) half wave structures (think of JOTA). As we use
100W maximum, high voltage at the feed point isn't a breakpoint mostly
(I have some CW Tesla coil experience).

The topic is: " It was known that different frequencies travel with
different speeds on a
long cable".

Is the same in air and space?"

The answers were YES.

What do you want to add?

Sure... the number density of ionized particles is somewhat bigger than
the 5/cc you describe above, so solar wind is actually not a big
contributor to it. Most of the ionization comes from UV ionizing the
air atoms/molecules. (that's what the whole daytime sky wave off the F
layer is all about, after all.. working Australia from the California on
20 meters at 5AM CA time probably isn't a good bet)

>> The aurora is NOT caused by acoustic waves.

> From: http://aurorahunter.com/aurora-prediction.php

That's not acoustic. That's just particles streaming out into space,
and because there's not many other particles to bump into, most of them
get to Earth

Cars produce the hot wind (exhaust pipe) with the acoustic waves. Is
possible to produce only streaming?
There must be the oscillatory flow.

you produce hot wind also... you should learn to listen and get into this century. no, the solar wind is not oscillatory, it flows from the sun all the way past pluto. it also varies in speed quite a bit so if the light was being propagated by the particles in the solar wind we would see large changes in the velocity and intensity coming from the sun that would be very easy to measure, and would likely have killed off all life long ago.

Richard
I didn't ignore choking the feed line but I will readily confess that
I did not choke it twice. Starting immediately below the bottom of
the matching stub I followed the recommendation of the various authors
and wound a multi-turn coax balun with a six inch diameter coils of
coax. They call for ten turns if I recall correctly. I was not aware
of the need for a second choke at one quarter wavelength away. Do you
have the energy to explain why that is necessary? How critical is the
length between the two chokes. Do I use the middle of the two chokes
as my measuring points? Could I substitute a one to one current balun
built of ferrite beads? That would have a less intrusive appearance
and accumulate less ice in the winter.
If you check the link that I gave for Ed Fong's dual band j-pole;

available here
<http://f1.grp.yahoofs.com/v1/
kL6QTZLk1DQjM_Cn3vuvnsLUIuEsvRHSqUZyX2mw294a7mYKkc
\FBIXXlRY_6QxreqNWVpn0b7Dogiw9LafU63W429yoO/DBJ2_port_art.pdf> or just
look it up in the files section of the Yahoo reflector; you will see
that he did test it in the field with fairly sophisticated
instrumentation. He uses a trapped radiator to obtain similar gain on
seventy centimeters as a simple J-pole without the trap gets on two
meters. His work was published in QST and I didn't find any
authoritative repudiation, or even strong criticism, of his design.
Why would the presence of the trap in the lower half wave of the two
meter collinear half wave J-pole wreck the tuning on two meters.

I'm only trying to learn here.

740. Fiberglass flagpole as antenna support?

Newsgroup: rec.radio.amateur.antenna
Date: 2011-04-02 20:31:10 UTC
From: Maude Herr-Chodt <maude@herr.chodt.org>
Message-ID: <4j4mjh.9m6.19.1@news.alt.net>
Source record: 5391

Currently my low-bands antenna consists of a sloping inverted vee. The center insulator is attached at the chimney support on the back of the house at about 27 feet above ground and is fed with open-wire line, which drops straight down into the basement shack. Each leg of the dipole is 75 feet long with 60 feet between the center insulator and a 12 foot 2x4 at the two fence corners. The last 15 feet of each leg then makes a 90 degree bend and is fastened to the fence top at five feet above ground.

The antenna in its current configuration seems to put out a good signal, about what one would expect for an antenna at this height. I have been thinking about adding a 40 foot self-supporting fiberglass pole at the center of the back yard fence. This would allow me to lengthen each leg by about 22 feet, and the two legs could be connected to an insulator mounted on the flagpole. In this configuration the ends of the legs would be elevated to an height of 40 feet. I could also remove the insulator, and by joining the two ends I would have a loop antenna with total length of about 194 feet.

Before expending money and time on this antenna modification, I would be interested in comments about what, if anything, I might expect in improved antenna performance.

At best, most any wire antenna for 80 meters below 100 feet or so is just a
crap shoot. The new configuration you want to use will probably work beter
in some directions and distances and worse in others.
If the pole did not cost too much, it may help if you can get the center of
the dipole up to 40 feet and the ends up some also.

742. Re: Helical-wound Monopoles

Newsgroup: rec.radio.amateur.antenna

Followup -- the link below compares the relative current distribution, directivity and radiation efficiency of a helical and a linear radiator system when the helical radiator described in my earlier post is operating at the frequency of its first self-resonance, and the linear monopole height is set for its first self-resonance at that same frequency.

It is interesting to note that linear form has better performance than the helical form.

Hi Tom,

This sound like very common advice - so common that it begs
investigation because it is common advice for HF Choking, not 2M, and
certainly not 70cm. However, this common advice acknowledges the need
for choking.

You would be better served using ferrites (W2DU style BalUn/Choke),
or, if you really wish to stick with wound coax, then use a Grid Dip
Meter to test its resonance (which should reveal you can't serve both
bands). Using an antenna analyzer to do this will give you measurable
Z, and that may give you the data to see how well you are doing. You
may wind a lot of chokes to discover that the diameter is
extraordinarily huge (or so the same for turn count - one or the other
or both).

>I was not aware
>of the need for a second choke at one quarter wavelength away. Do you
>have the energy to explain why that is necessary?

[Do I have the energy.... With all the junk cluttering this space
outside of this thread, I have plenty of energy.]

The antenna fields will try to excite the transmission line's common
mode (the shield of the coax that it sees). This will induce currents
that will become radiative (just like stacked elements in a vertical
multi-element radiator - sound familiar?). The use of chokes at
quarterwave intervals snubs these currents.

Sometimes more chokes are needed. I use a 20' long line with a bead
every four inches or so. The intent is to create a very long resistor
(very wide bandwidth) with very short leads (very high frequency)
between its distributed resistance.

>How critical is the
>length between the two chokes.

Not particularly, you would be well served to attempt to make it at
the interval of quarterwave at the highest frequency used (70cm).
This, then, would snub lower frequency (2M) common mode currents.

>Do I use the middle of the two chokes
>as my measuring points?

This sounds deceptively exact (and probably a consideration for those
enormous chokes of common advice vintage). No, such exactitude is
going to be lost at the 70cm scale anyway which will be perturbed by
other factors (have I talked about environment?).

>Could I substitute a one to one current balun

>meters.

My background was working in the standards laboratory system of NBS
(my speciality was RF measurement to the highest accuracies). I know
that sophisticated instrumentation and quality results don't
necessarily track each other. My point was about environment, not
instrumentation anyway. You don't need $1000 meters, but you might
need $1,000,000 environment.

The description of Apple's echoless environmental chamber used to test
their iPod is a marvel of engineering, and cost a stack of dollars.

>His work was published in QST and I didn't find any
>authoritative repudiation, or even strong criticism, of his design.

The same could be said of publishing it in Playboy. QST needs content
to offer subscribers. Vanity articles satisfy that need. Think of
these articles as the introduction to a topic, not the final word.

>Why would the presence of the trap in the lower half wave of the two
>meter collinear half wave J-pole wreck the tuning on two meters.

The trap's tuning is heavily influenced by the geometry of the
elements because they are also part of the tuning. The trap disturbs
that symmetry. You have also introduced new L and C components that

further upsets the total circuit. These things are not super-critical
when you consider that moving a resonance (say) 145KHz out of 145MHz
is only a shift of 0.1%. That isn't super-critical either.

Or maybe it is.

>I'm only trying to learn here.

Let me know if this helps.

Hi Maude,

Cut off the last 15 feet (4M?) of each leg. Keep your antenna away
from ground - your tuner will make up the difference anyway. You are
already using a tuner, aren't you?

Do it and report back. It satisfies keeping the antenna high. You
have alternatives (short, don't short), and it adds variability for
other considerations.

Mr. Clark -

Your posts are occasionally informative, but usually not, as
demonstrated here. You have not offered anything of technical substance
in so many of your posts. It is obvious that you are knowledgeable in
the subject, but you seem to have a problem communicating that
knowledge. We could all benefit from your knowledge, but please do so
with direct technical information rather than the example above.

Please,
John

Yes, I'm using a balanced tuner. The problem with 60 feet legs is that while it matches nicely on 80 meters, on 40 meters it becomes difficult to match, given my current feeder length. Adding the additional 15 feet to each leg ends up with a reasonably easy match on all bands (80 - 10 meters). In addition, I feed the antenna as a Marconi (inverted L configuration) on 160 meters, and the additional 15 feet on each leg again makes it easier to match.

Hi Maude,

Cut off the last 15 feet (4M?) of each leg. Keep your antenna away
from ground - your tuner will make up the difference anyway. You are
already using a tuner, aren't you?

Do it and report back. It satisfies keeping the antenna high. You
have alternatives (short, don't short), and it adds variability for
other considerations.

Hello Richard Fry,

Why is this so interesting, as it is what I expect (and I think you expect this also)? The current*(physical length) product is more, so given same feed current it produces more field (hence more radiated power). This results in higher input impedance, hence reducing the 10 ohms ground loss.

The small change in shape of pattern is just due to the less isotropic array pattern of the 0.25 lambda radiator (w.r.t. to the array pattern of the 3 m radiator).

If it is not time consuming, I would like to see what happens when you extend the helix until it gets its second (half wave) high impedance resonance (current maximum in the middle). I expect some gain increase due to small change in antenna pattern and reduced ground loss.

¡Very informative thread!

Hi John,

Technical chaff is rarely useful information. I am pretty sure that
was the point (but it is a rather Baroque discussion) Richard was
trying to illustrate.

Simple observation will reveal how this thread has become about trying
to get the camel through the eye of the needle: Richard's link points
to data that reveals differences displayable (and arguably
measureable) only out to 10% - that is pretty meager steam for heated
rhetoric in this engine of discussion (it has been far more about
purple prose than substance before I dipped my oar here).

no, the changes don't always make aurora, and they are definately NOT
small. watch the speed on this for a few months, even without aurora
and see how much it changes. if the waves were traveling on the
charged particles then they would change speed just as much:

Assuming ladder-line feeding 60 foot legs, switch between a 1/2WL
feeder on 80m and a 3/4WL feeder on 40m and get a near-perfect match
on both bands.

This thread has shown me that I don't know enough about Common Mode
Chokes. I think they might also be referred to as transmission line
chokes.

What I need to know is
1- When to use them. RF in the Shack is pretty obvious
2- When not to use them. There must be some negatives.
3- "Compare and Contrast" the Inductor-capacitor choke with the
Ferrite Choke(W2DU). Are they electrically equivalent?
4- Are either of them a multi band solution?
5- Are there Upper and lower frequency limitations for using them.

As usual, a Google search provides an overwhelming set of responses
that most likely will cover the subject in greater detail than I can
digest.

Early in the list provided by the search I discovered
http://www.audiosystemsgroup.com/RFI-Ham.pdf

That may have all the answers but I have only glanced at the beginning
of the 66 page document.

150 000 000km / 4days = 150 000 000 / 350 000s = 430 km/s.

For you it is the speed of the solar wind.
For me it is the speed of acoustic waves.

According to Faraday and today scientist the plasma is like metal.
Ions are the medium for acoustic waves and electrons for the electric (in
metals and in plasma).

Have you a link with the method for measure the speed of solar wind?

go to that link i gave you above, the 'normal' speed of the solar wind
like now is over 500km/s, it gets much faster when there is a coronal
hole or from a cme.

Richard
Ed Fong's article can be found on the ARRL website at
<http://www.arrl.org/files/file/Technology/tis/info/pdf/
0302038.pdf>.
I was able to access the above link without any password or other
challenge. I just reread it and found that he does address the
changes in the two meter element brought on by the inclusion of the
seventy centimeter trap. For one thing it shortens the two meter
element somewhat. So let me propose a modification process for my
collinear dual half wave two meter j-pole and you can tell me if you
can think of ways to rearrange or modify the steps so as to move
towards by hoped for results. What I hope to achieve is to maintain
the gain of the stacked, out of phase, dual half wave antenna on two
meters AND trap the lower have wave to a single half wave on seventy
centimeters.

Here are the steps I was thinking of:
Fabricate a trap from 1/2" copper pipe coming out of a tee that has
been cut in half through a plane perpendicular to the foot of the
tee.
Remove the top half wave and the phasing loop from the existing
collinear dual half wave antenna
Attach the stub to the lower half wave so that the open bottom end of
the stub is one half wave on UHF from the top of the matching stub.
Measure the SWR on 446 MHz. of the newly trapped two meter radiator.
Adjust stub location for minimum SWR at 446 MHz.
Measure SWR at 146 MHz.
Shorten that radiator to lowest SWR on two meters or until the two SWR
readings for VHF & UHF are equal.

Reattach the upper two meter half wave and phasing stub.
Measure antenna for SWR on both VHF & UHF again
Adjust length of of upper two meter half wave if necessary.

The antenna analyzer that I will use will be an AEA Technology SWR Meter: 140-525. It happens to be what I have available to me.

Does my process seem to be along the right line or would you suggest a different order of operations?

<jferrell13@triad.rr.com> wrote:

> What I need to know is
>1- When to use them. RF in the Shack is pretty obvious

Hi John,

Sometimes it is not always that obvious, but it can be made obvious. I say this because the symptoms do not always draw our attention to the problem arising from Common Mode (CM) current.

One possible obvious symptom is that you can feel the current on the shielded components of your system - like a microphone shell when your lip brushes along it (which can sometimes give a nasty shock); or when you pull a connector and get that tingle of feeling (which might kill you if conditions were worse). "Obvious" can vary from subtle to deadly.

Another possible obvious symptom is you are moving a transmission line while keyed down, and you notice your SWR shifts at the same time. Is it because of a faulty connection? Sometimes yes, but we are talking about CM; and when it is CM, then that shift in SWR is because a tuned circuit (the line is now part of a dynamic system) has been changed.

* * * * * * * * *

Let's set aside in-the-shack symptoms and look at the antenna end of what might be obvious.

For beam antennas, through careful testing with known remote stations (beacons, for instance) you find that you have high sidelobes, almost no back rejection, and a broad response off the front. The transmission line coming down is acting like a vertical antenna, and is feeding its drive into the antenna feed point (two antennas in parallel). That extra antenna is picking up stations that would normally be suppressed by beam design.

Some folks never notice this - and it shows how benign CM can be (it is there full blown, but it is NOT obvious at all).

For wire antennas, you cut and cut and trim and trim your antenna to frequency, but even though it is book perfect (using the usual formulas for length), it is wildly out of whack and a bitch to tune with your tuner. Your dipole without choking is actually a tripole: two horizontal elements with a third vertical element (which is variable in length and relationship to ground/environment as it swings

in the wind). You raise it higher to see if that does anything, and the tune shifts to the moon because the third element has gotten longer.

Again, some people never notice this, we have seen them; others do notice it and fulminate against the dipole as being a useless invention where their endfire (which suffers the same issues, but is magical by comparison) antenna is the cat's meow.

More could be said....

>2- When not to use them. There must be some negatives.

That is a natural question, but I cannot think of any down-side at all.

>3- "Compare and Contrast" the Inductor-capacitor choke with the
>Ferrite Choke(W2DU). Are they electrically equivalent?

They are NOT electrically equivalent. The ARE functionally equivalent - that is, they both suit the same purpose of introducing a very hi Z into the current path of CM.

The coil of transmission line is, on first pass approximation, an inductor whose Z climbs with applied frequency. The presumption is that it can only get better for the higher bands. This works to a point, but the same coil of TL also has loop-to-loop capacitance, and end-to-end capacitance. These two capacitances, at some frequency, become resonant and offer you a tank circuit. This works even better to isolate the current at the drive point from the rest of the line. However, a tank is not a wide band device by definition. It can exhibit an extremely hi Z at one frequency, and often high enough Z in neighboring bands (hence it is useful if you understand this). As you go higher in frequency, and for the very large coils suggested earlier, then the capacitances begin to dominate and actually kill any sense of choking.

The ferrite choke is a resistor, plain and simple. This means it is wide-banded - although its frequency characteristic is not universally applicable (this widebandedness usefully covers two, maybe three octaves). The formulation of the ferrite determines the coverage, and so you can either throw more beads into the mix, or use beads of different formulations to create a more flattened frequency response (over decades of frequency change).

>4- Are either of them a multi band solution?

Yes, as described above.

>5- Are there Upper and lower frequency limitations for using them.

That too is described above.

>As usual, a Google search provides an overwhelming set of responses
>that most likely will cover the subject in greater detail than I can

>Early in the list provided by the search I discovered
>http://www.audiosystemsgroup.com/RFI-Ham.pdf
>
>That may have all the answers but I have only glanced at the beginning
>of the 66 page document.

It is a very good and broad discussion. The downside is its enormity.
However, this is not a simple topic and understanding comes slow.

The reason for that is that Common Mode analysis as distinct from
Differential Mode analysis immediately brings up the specter of WTF?
There are TWO currents flowing at the same time in the same circuit?

This perspective is usually very foreign and takes deep meditation to
come to grips with. It is difficult for the majority of the Pros too.

I am going to prompt readers for the next question:
"What is common mode current?"
If any one cares to indulge me by asking, we can go further, but the
material in this posting is enough to digest in one sitting.

Hi Tom,

Right off the bat (yes I can see the article now) you offer a
conflict. Out of phase blurs gain (lowers it). Your statement
suggests you are losing from the start.

However, it could simply be wording. Let's make this simple:
1. State the gain at the frequencies of interest before the change;
2. State the gain at those frequencies you expect after the change.

>Here are the steps I was thinking of:
>Fabricate a trap from 1/2" copper pipe coming out of a tee that has

1>Measure the SWR on 446 MHz. of the newly trapped two meter radiator.
2>Adjust stub location for minimum SWR at 446 MHz.
3>Measure SWR at 146 MHz.
4>Shorten that radiator to lowest SWR on two meters or until the two
SWR
>readings for VHF & UHF are equal.

Probably not. You are going to be repeating steps 1-4 to even
approach this desired end condition.

5>Reattach the upper two meter half wave and phasing stub.
6>Measure antenna for SWR on both VHF & UHF again
7>Adjust length of of upper two meter half wave if necessary.

This will disturb the work done in steps 1-4. You cannot rely on that
configuration being isolated from the work in steps 5-7 which will
also demand repeated attention. However, proceed with 5-7 repeats
until you obtain the desired end condition.

NOW, revisit steps 1-4 with everything attached. I may be wrong, but I suspect you will need to trim things here again. And guess what? This means you need to visit and repeat steps 5-7 again.

And guess what? You will be visiting steps 1-4 AND 5-7 again, and again.

Take heart, these revisits "should" result in ever smaller adjustments. That means you will approach your desired end condition asymptotically.

>The antenna analyzer that I will use will be an AEA Technology SWR
>Meter: 140-525. It happens to be what I have available to me.
>
>Does my process seem to be along the right line or would you suggest a
>different order of operations?

The order is quite rational and fully expected. You are entirely on the right track. Your experience will reveal how much they are interactive and how sensitive all this is. If you anticipate the amount of repeated operations and plan accordingly, it will go far more quickly.

Epilogue

I would note that your writer does not offer any testing of sufficient caliber to support the claims of the EZNEC model. He merely provides signal reports using a sophisticated instrument (a spectrum analyzer that is not being used for spectrum analysis). Those reports also tell me that there is at best 1.2dB gain over a 1/4 wave design - very underwhelming. The only SWR data is reported as "The SWR was low."

The NEC software that I used for the results shown earlier doesn't allow enough segments to double the length of that helix. So I reconstructed the model in one that does -- link to screen clip from it below:

Hello Richard Fry,

Thanks for taking the time to do the simulation.

It seems from your graph that the electrically half wave (180 degr)
helical has slightly more gain than the physically and electrically
quarter wave (90 degr) radiator (5.61 dBi for the helical versus 5.14
dBi for the quarter wave whip).

Given the about 4 kOhms for 1/(Re(Y)), the loss in the 10 Ohms ground
resistance is negligible (so at can be significantly higher before
presenting significant loss). 900Vp at the feed point (100W input)
will not give problems with matching.

With kind regards,

Wim
PA3DJS

What fun would that be? We should cast away our aspergian proclivities and embrace the occasional foray into acerbic wit.

Which is to say that Yes Richard knows something, and sometimes he'll make an amusing comparison. If you ask, I'm certain he'll explain a subject he's commented on if you ask.

And there is something in the donuts versus apples comparison.

The only one we're not allowed to use is apples and oranges.

A full-length half-wave monopole has gain over a full-length 1/4WL
monopole because the current maximum point on the half-wave is
elevated by 1/4WL. The same concept has to be a technical fact for the
helical even though muted by the smaller physical distance between the
current maximum points.

One antenna is physically larger, though, right: 5.535m vs 3m?

How is radiation efficiency calculated here? Integral over hemisphere of radiated power vs applied power Seems like that would be 12.17/(10+12.17) vs 36/(10+36), so you're really just seeing a manifestation of the different feedpoint impedance vs ground losses (which you've assumed fixed..)

I'm not sure the assumption of fixed ground losses is reasonable here. (Actually, now that I think about it, it might actually be worse for the shorter element, in real life)

The other thing is that the shorter radiator is going to have a "lower directivity" pattern vs the longer. That is, a shorter one will tend towards the "Hertzian infinitestimal dipole" with 1.6dBi while the longer will be closer to the 2.15dBi.

I thought this was a likely scenario but you are the first I have
encountered that passed that along. Somewhere I read about a fellow
who was using spool of coax in the shack for a choke on 160M...
Well intentioned, but clearly not really a solution!

It is you who are indulging me!

Google and other Internet resources are very helpful but they are a poor substitute for direct answers to direct questions.

As the sailor told the Captain, "I won't abandon the ship until the keel comes through the foredeck!"

It seems to me that I might get an indication of current on the outside using a Grid dip meter as a detector at various points on the transmission coax.

I used to use a 48 element Collinear antenna on 439.25 MHz for Amateur TV in Ohio. It was designed by WA8RMC and constructed by WB8LGA.

The procedure to verify that each element was contributing something to the array was to power it with a small signal then watch a field strength meter as far away as you could see it and touch each element to see if it would produce a wiggle on the meter.

No wiggle means that particular element was not doing anything. I think you could do something similar to verify things are coupling.

That particular antenna was a collection of 24 dipole/reflectors in harness. I have been thinking about building another. It was only 4 feet by 6 feet but a whole lot of wind resistance.

I intentionally did not clip this post to keep things in context...

Hi John,

Another method (that I have not tried, and may be apocryphal) is to
take large piece of tinfoil in your hand (the tin foil is gripped
around the line) and move it along the line while watching the SWR
meter.

The tin foil is used as a means to increase YOUR surface area to the
line because you are the major conductor that is moving. You have
diverted the Common Mode path away from where it was going, by moving
into your hand, through your body, to your feet, and ground.

One very sure method is to insert an additional length of transmission
line in series (will require a barrel connector). Some lengths are
more dramatic in the shift of SWR than others (again, this is about
wavelength).

This method has been reported to us here more than several times -
unfortunately the reporters hadn't connected the dots to recognize
this was a confirmation of CM.

>It seems to me that I might get an indication of current on the
>outside using a Grid dip meter as a detector at various points on the
>transmission coax.

Get a split core ferrite. Snap it around the coax. Add a short length
of wire through the core. Connect the ends of the wire to an LED (now
a complete circuit). Move the core/LED along the line during
key-down. Did the LED glow?

Make sure to test the LED first to see if it glows (I can't imagine
why it would not). Test the LED after this survey to see if it glows
(I can imagine that CM current could have fried it). Play with adding
more turns of the wire through the split core.

You have a simple portable RF transformer/indicator.

Let's say I build a horizontal dipole, trimmed for minimum SWR @ 7.200 mhz. I'll probably use 14-16 gauge insulated house wiring for this antenna. It'd be a "nominal' quarter wavelength per leg.

This dipole will be fed with 50 ohm coax, and it will be erected horizontally, 30 feet high over "average" ground.

What SWR reading could I expect to see from this antenna if I tried to use it at 21.300 mhz.....in the same environment as stated above?

Thanks, folks......

I was wondering if anyone has experience interference from Solar Power Inverters.
I'm currently access various inverters and noticed that the Kaco Powador-4202 uses a high frequency isolation transformer, so I'm particularly interested in experience with this model, but also keen to hear general experience with these domestic solar power systems.

When TV was in in its infancy and in Ham TV we frequently used 300 ohm twin lead transmission lines. The effect was dramatic when you wrapped foil around the twin lead and moved it up an down the feedline. If a half wave of line was accessible, You had the full range of tuning.

I also have a meter stick with a pair of wires on which I can slide a shorting bar. The usual indicator is a 50 micro amp meter with a 1n34 germanium diode and either a dipole or sense loop attached. Nearly all of that work was done at 440 mhz.

I will think about that LED indicator. Usually I keep the power low when doing this sort of thing. The threshold required to trigger the led. Also, once it triggers the abrupt transistion would probably affect the operating conditions. Perhaps it is time to increase the power a bit for such experiments...

I, and one of my friends, did have problems with a solar "charge
controller", which I use with a small solar panel to trickle-charge /
float an AGM battery.

It's apparently based on a buck-mode switching voltage regulator,
down-regulating the voltage from a panel (nominal 18 volts
open-circuit) to the lower voltage and higher current needed to charge
a lead-acid battery properly. When my friend first installed one, his
comment was "Holy QRM, Batman!". The switching noise was sufficient
to wipe out reception on his HF radio transceiver nearby.

My guess at the time was that most of the RF was being radiated out of
the solar panel and the 15-20' of wire running to it. I suggested
buying a standard AC power-line filter module (the sort made by Corcom
and many others) or two, placing one on the solar-panel side of the
charge controller and the other on the battery-being-charged side.
These modules can choke/filter out both common-mode and differential
noise.

This completely eliminate the QRM problem. Apparently the amount of
RF noise radiated directly by the controller itself is negligible...
the switching noise is only a problem if it's fed into wires long
enough to act as antennas.

EMI filters of this sort aren't hard to come by on the surplus market,
and are also available new. You might want to consider spec'ing a
filter of this sort as part of any solar-charger or solar-inverter
system you have installed. RFI/EMI levels which are low enough to
meet legal requirements, may still be high enough to interfere with
some sensitive communications... extra filtering may save you from this.

Hey Cecil -

I got:

Impedance = 85.26 - J 186.3 ohms
SWR (50 ohm system) = 10.337 (75 ohm system) = 7.308

Let's see if we can determine why they don't match.

I adjusted the wire length for no reactance at 7.2 MHz.
I used 99 segments of #14 wire. I did not include insulation effects.

How about yours?

John

Oops! I just noticed that I had zero wire resistance. Changed it to
copper but only got a slight change:

Impedance = 87.47 - J 184 ohms
SWR (50 ohm system) = 9.960 (75 ohm system) = 7.042

I don't think so ...

Ocean waves, sound waves, through water/air, pretty much, and just vibrate matter in place. They don't really use movement of matter though matter as locamotion, i.e. no "real" matter gets transported, they simply affect more matter, by "bumping it", which in turn affects more matter, etc. Or, simply matter vibrating ... energy vibrating it.

Ions are like bullets, they do use movement as their means of transporting themselves, and they don't "remain in place."

Ether fills space, the space between the atoms of air, and all other matter (and, most likely, even fills the space within an atom!) ... it simply can be made to "vibrate", like water vibrating in place and creating waves which transverse the pond ...

The ether/wave model is the only model which can, and in quite simple terms and design, account for waves transversing non-empty space (a vacuum containing only ether.)

All other models which have been constructed require elaborate explanations and examples which are only imaginary in existence (no direct physical examples can be had/seen.)

Someone should be able to make quite a comfortable monetary living keeping Occams' Razor honed sharp!

Regards,
JS

If you tune it down a bit so you resonate at perhaps 7.15, then the
third harmonic will be closer to 21.3. It's a dipole, so not real high
Q, particularly on the fundamental, so maybe what you do is go for a
compromise tuning.. A bit low on 40 and a bit high on 15.

I think may have missed something on how segmentation works. I thought
you needed an even number of segments to split a dipole evenly.

So while 99 is close to centered by my logic, if 9 was used it might
skew things a bit.

If I'm off base please tell me so I can adjust my model of how NEC works.

Thanks.

Hi, Tom -

As far as I am aware, using an odd number of segments in a wire allows
the source to be placed in the center of a segment with equal numbers of
segments on each side.

Think of it this way: a source needs to be in the middle of a segment.
So, you need an even number of segments on each side to keep everything

balanced. If so, then the total number of segments needs to be odd.

If this does not make sense, please ask again and I'll try with more detail.

Cheers,
John

Just put it up and see what happens.

Slap a tuner in the line.

Or check out a fan dipole.

Or buy a pair of 15 meter traps and use the design sheet that comes
with them to build a 40-15 trap dipole.

I've used parallel fed "fan" dipoles for years.
But I've never bothered with legs for 15m..
Always used the 40 m legs for 15m.. Guess a habit back
from my novice days.. Back then, my old transmitters
would match either load no sweat.. No tuner required..
Heck, I didn't even use an SWR meter when I first
started.. :/ Never missed it either..
With my modern rigs, the match on 15m, using the
40m legs is usually a tad higher than I'd like for
S/S finals.. :(
So I slap a tuner into the picture as a "line
flattener". Even a cheapy MFJ random wire tuner will
match that.. And most internal radio tuners could
probably handle it ok.
It's not too far off from being a 3/4 wave on 15m.
None of my radios have internal tuners, but
I have several stand alone tuners.

All real waves are asymmetric. For this reason they transport mass.

I prefer Faraday's idea. No aether. In space is the same as in metal.
Wibrating ions and electrons.

>.. it simply can be made to "vibrate", like water vibrating in place and
>creating waves which transverse the pond ...

In aether model aether vibrate and particles "are in place". In Faraday's
model particles vibrate and no aether between them.

> The ether/wave model is the only model which can, and in quite simple

In real space no aether but ISM (rare plasma + dust).

> physical examples can be had/seen.)

The same speed of electric disturbances in copper and light in space was the
physical examples for the idea "no aether but vibrating particles".

"I suppose we may compare together the matter of the aether and ordinary matter (as, for instance, the copper of the wire through which the electricity is conducted), and consider them as alike in their essential constitution; i.e. either as both composed of little nuclei, considered in the abstract as matter'. From: http://www.padrak.com/ine/FARADAY1.html

In above Faraday use the word aether but he explains what it is made of. Today we say space. Space is filled with ISM.

but in vibrating particle waves like sound waves the speed of the wave
is very dependent on the density of the material. with sound waves
the waves travel faster in dense material, compare the speed of sound
in air and a metal bar. with electromagnetic waves that is backwards,
they travel slower in dense material and fastest in a vacuum.

Thank you for the response, folks. I appreciate it.

.....and OUCH!!!.....

The swr is higher than I had hoped for. I was hoping to use a duo-band 15/40 meter wire dipole that could be fed directly with 50 ohm coax connected to my Yaesu FT-450AT with internal tuner.

But the FT 450 AT internal tuner will only match up to a 3:1 swr, so that won't be "do-able".

Thank you again......

See QST Dec. 1991 Hints and Kinks. The author cut the dipole for the
low end of 40M~67' and used a Q section of RG59 cut for 21 MHZ to
improve the match on 15M.

Ether severs another import avenue to explain another observed
phenomenon. How two particles can exist at the same place, at the same
time -- ether is the medium transporting the information so that this

becomes quite possible. Even makes the concept of time travel theoretically possible, indeed, being in two times, at the same time only appears as a possibility which exploits the same phenomenon.

For electric waves electrons are the medium. Ions are like the sand or fog
in air for sound waves.

And, I favor Einstein and the gravitational aether.

However, I am hoping CERN, when in full swing, will start churning data which tosses the truth to one side, or another ...

Often, a search for one thing/phenomenon/effect/affect/etc. will, quite surprisingly, answer a totally different set of questions in an obtuse angle to the intended direction of the original questions.

Anyway, I can always hope ...

Actually, if you extrapolate the most likely possibility of what ether is, it is most likely, the smallest possible particle of what all matter is made/composed of.

And, because of the obviously, most extreme diminutive size of these particles (which ether is), the ether particles exhibit properties/qualities which do not even "see" these larger constructs of itself ...

I always use an odd number of segments, and the middle segment is where
I feed it. The voltage source is essentially in series with the
segment, and if your segments are short enough, the current distribution
along the segment is effectively uniform, so it makes no difference.
OTOH, I'm running NEC4 with a lot of memory in double precision, so
using hundreds of segments isn't a big deal.

I think it *will* work (based on practical experience.. I've done this a bunch of times).. you just need to fiddle with the length to get an acceptable match in both bands. And, of course, you're not going to get something which matches the bottom of one band and the top of the other.

People fling up dipoles (theoretical feedpoint Z around 70 ohms) and feed them with 50 ohm coax all the time and never give it a second thought. (partly that's because rarely is the dipole perfectly flat.. if it droops or peaks up, the Z gets closer to 50 ohms)

I agree, it may very well work acceptably. I've been able to get a similar 40-meter wire to match up OK on 15 meters, using the autotuner built into my Kenwood TS-2000.

Another option would be to add some sort of matching element, either at the antenna or at the rig, which would bring the feedpoint impedances on both bands to within the ranges acceptable to the rig's internal tuner.

If the antenna is close to 50 ohms resistive in the 40-meter band, and is around 85.26 - J 186.3 in the 15-meter band, then you could consider adding a series coil at the antenna feedpoint. If I'm doing the numbers right, an inductance of 1.5 mH at the feedpoint would cancel out the 186 ohm capacitive reactance almost exactly, leaving you with an 85-ohm resistive impedance or an SWR of around 1.7:1, which should be quite easy to drive.

This much inductance would change the feedpoint Z on 40 meters to around 50 + J60, so the SWR would be quite a bit more than 1:1... probably still within the range of your tuner, though.

Several ways to deal with this:

- Compromise, by using less series inductance... maybe 1 uH - this wouldn't lower the SWR on 15 meters as much, but would raise the SWR on 40 meters less. Calculate and fiddle a bit and you can probably find an inductance which will result in similar (and very comfortable) tuning SWRs on both bands.

- Instead of a plain L at the feedpoint, use a series LC - one which is series-resonant at 40 meters (thus adding no reactance and not changing the SWR at all) and has a net reactance of J186 at 15 meters.

All of these techniques will narrow the SWR bandwidth on 40 meters somewhat, but with care you should end up with an easily-tunable antenna.

This request from last year did not garner many specifics other than that one should be aware of disturbances from other stations when using most available instruments. One mention of the AIM 4170 was made by K6MHE and the use of a GR bridge was mentioned by several including Walt.

If might be interesting to several to learn what K1PO ended up using.

While I have a GR bridge and the CIA hand held meter, I have found the AIM 4170 to be ideal. It ends up being used for several tasks and has not been disturbed by RF from others when connected to an antenna. Its ability to characterize a crystal is great - especially to someone who has done it the old way. This evening, I confirmed that one can use it to characterize a piece of coax for velocity, Zo, and (matched) loss. . . . and it is very easy to store the Z vs. frequency for latter comparison. . .

Another data point. 73, Mac N8TT

Be a chemist for a while. (Faraday was).

For a chemist everywhere is the saturated vapour, because everywhere are
solid bodies. Interstellar mediom = rare plasma and dust = saturated vapour
+ dust.
Such medium is ionised = contain ions and electrons.

Search for the answer if in such medium can propagate an electric waves.

You should find, quite surprisingly, that waves (vibrations) cause dust
coagulation (gravitation). Faraday predicted it.

Your insite is just astonishing. You notice all the details from all of
the masters and combine them into something that NO ONE CAN DENY!!!!!

You are the awesome collector of all knowledge (supplied by Google) that
makes it all clear.

I find that Ampere, Faraday, Stokes and Tesla are to difficult for teaching
programs. But their ideas are right.

For students the best is the magnetic whirl and solid aether.

Do you think that Tesla was using the knowledge from the textbooks?

I was hoping to find someome having thoroughly read the article and ready to
discuss his doubts.

Discussing the issues, starting from scratch, would lead to too long a debate.

>I was hoping to find someome having thoroughly read the article and ready to
>discuss his doubts.

Hi Tony,

To answer my question, it is not all that very difficult to give us
some "opinion-based" appraisal, the article was:
1. not particularly distinguished;
2. remarkably good;
3. remarkably bad.

However, if 2 or 3 is offered in response, then there is something to
remark. If it is remarkable, then there is some technical aspect to
discuss (which means we depart from opinion, unfortunately, for the
discussion to become rational).

I see no one offering a technically specific comment nor a general
opinion. By this benchmark, then, this article must not be
particularly distinguished or it is buried in an undistinguished
publication.

However, given Brett's link I would find nothing at that link to
debate either. On the positive side, that writing seems to rise above
undistinguished work, but if you are not going to commit yourself, or
provide deeper insight, then my observation is strained to give it
that much benefit.

>Discussing the issues, starting from scratch, would lead to too long a debate.

The dynamics of discussion here are self regulating. It would seem
the "debate," after six posting has yet to begin (and we are thus in a
long discussion about the shape of the debate table).

I have a 22 lb box of QEX magazines from June 1982 to 1994.
About 140 issues. I don't know if they are all there but most are.
If anyone is interested in them, $10 plus shipping from 32405.
Email me if interested.

From the ARRL Web site itself:

http://www.arrl.org/arrl-periodicals-archive-search

"About this database. This database contains an index of articles for QST from 1915 to the present, QEX from 1981 to the present, Ham Radio from 1968 to 1990 and NCJ from 1973 to the present. (Note: Beginning in 1998, each issue of QEX covers two months. This index shows the first month. For example, the index shows the January/February 1998 issue of QEX as Jan 1998 QEX.)"

So, the index covers anything for which I'd be interested. But I am more interested in obtaining past articles. Then there is this:

"QST Archive for Members Only - ARRL Members can access the QST magazine archive online, from December 1915 through December 2007."

Also:

"ARRL Periodicals on CD-ROM - Recent volumes of QST magazine and back issues of QEX, NCJ and Ham Radio magazines are available on CD-ROM."

I guess this means that, if you want to get articles later than 2007, then you must buy the CD.

Thanks for spurring my research on this. Now I will re-evaluate the importance of remaining a member.

John

I kinda thought that was what I was doing by being a member.

I've been paying:

ARRL membership $39
QEX for members $24

Total $63

If I drop my ARRL membership the cost would be:

ARRL membership $00
QEX non-member $36

Total $36

Almost a 43% reduction in cost to get the cream of publications. Of course, I'd be giving up QST. Somehow, that doesn't bother me too much.

John

I re-joined ARRL a few years back after having let my membership lapse because of what I considered a lack of technical articles in QST. I was primarily a member to get QST. After my membership expired again, I got boatloads of mailings from ARRL, begging me to come back and even offering a choice of a book to get me to come back. I mailed back their letters with a hand written note saying I wasn't interested. They asked me why. I said QST isn't nearly technical enough for me anymore. They suggested I get QEX. So I made a "counter-offer"...I asked them to substitute QEX for QST. They basically laughed and said they couldn't do that. Seems it would have saved them some money as QEX only comes out 6 timers per year versus 12 for QST. So, now they get NO money from me...

I would respectfully suggest that you are missing the big picture. It's
not just the magazine(s).

Like them or not, the ARRL is the ONLY organization that supports ham
radio on a national level, going to bat for us before Congress and the FCC.

73,
Joe

Here in Au the number of members of the representative body (WIA) is
about 1/3 or less , having really bad representation which is expensive
is worse than having none at all

I like the little ads in back. It's interesting how they market some of
those radios. It reminds me of Sansui stereos.

QST is about the ads. QEX appeals to people who are pretty immune to ads.

Well, maybe. I think that the big picture depends on the desires of the
observer.

It is not that I do not like the ARRL. I've been a member for many years.

But, just being a member doesn't pay for that support. Notice from the
cost of membership shown on the ARRL site that only $8 per year is left
over after paying for QST. I'd bet that that $8 barely pays them to
maintain their records and Web site. What they apparently depend on for
money to represent us in Washington is donations. Along with volunteers,
perhaps.

So, does this mean that those of us who do not send in donations are
missing the big picture?

Well, I overlooked the revenue generated by ads in QST. It is probably
true that a greater membership means a greater magazine circulation
which means ads can garner more because they reach a greater audience.

I just wanted that on record to show I am not advocating discontinuing
membership.

Yes, I understand that very well. However, they should have more money
to spend to fight for ham radio if they would let me substitute the 6
issues per year of QEX versus the 12 issues of QST.

Not necessarily..

Advertising runs as "cost per thousand" (aka CPM) based on the
circulation of the magazine. The CPM for QST and QEX is probably pretty
close (same target market and all that).. You could probably find it on
the rate card which is on the ARRL website somewhere.

Let's say the rate is $1/thousand..

So, for a given size ad, QST may have, say, 150,000 copies, and QEX may have 1500. So ARRL would get $1.50 for an ad in QEX, and $150 for the same ad in QST.

Printing costs are pretty much the same, per copy, per page. However, the other production costs (editing, copy, pre-press) are fixed, regardless of how many copies you print. So for QST, the "per page per copy" cost is a lot less.

QST is probably MUCH more profitable than QEX.. lower cost to print a copy, more revenue to collect per copy.

For reference, the QEX ad rates are $155 for 1/6th page up to $733 full page. NCJ is 412/page, 78/sixth

I couldn't find circulation numbers for any of them, and no published rate card for QST. (I assume QST has lots of "multipage discounts", for instance).

I'm basing this opinion on the ARRL budgets that were published in QST about 20 years ago. They currently (still) claim they are there for mainly 2 things, protecting our rights and privileges as operators and adding new operators through education and other methods. Unless they have gotten rid of all the bits they used to have that they didn't need, they are still spending between 2 and 5% of the money they collect on what's supposed to be the main goal.

Where does all the rest go? Read the budgets if they still make them available.

Charlatans then, are they now? I don't know. And don't care. They lost me.

I think if you have a noisy one, you have reason to complain -- and
get satisfaction. I used to work in a US Navy office building.
Although "domestic" doesn't apply, it did have a large PV array
installed. After it was running, I took a portable AM radio on the
roof and I had to get within inches of the array to get any hash at
all. I swept the dial to be sure; also walked around to check several
places. Sorry, the controller equipment was locked away. No close-up
test possible.

By contrast, I use a small switching PS for my 220 handheld on our
local Net Night. If I don't unplug it, I'm reminded by my S-meter as
soon as we move to HF. It is one noisy, little bugger.

Pretty well identical with the UK situation. The RSGB have lost many,
many members for these reasons - including me.

tom, just my personal opinion, but too bad you left the ARRL and too bad
you don't care.

I don't know about your "2 to 5%" figure, but even if it is true, it's
exactly 2 to 5% more than any other organization is spending to go to
bat for ham radio...and IMHO, we NEED (and should support) a national

organization.

Several Saints say,
"You live in a time wherein it is of
Great Importance that many people
understand that the Gift of human living
is a Gift far greater than it is often
understood to be. So much is taken for
granted and even passed over, not seeing
or not realizing the value of what life
was created to be, to have, to follow and
to one day be known for."

REVELATION DELIVERED THROUGH FRANCES M. KLUG
ON DECEMBER 5,2006 AT 12:17 P.M.

SEVERAL SAINTS

"There are Several of Us with this
little one as there so often is, but We are
making a point of it today because of all
she has endured up to this time.

You live in a time wherein it is of
Great Importance that many people
understand that the Gift of human living
is a Gift far greater than it is often
understood to be. So much is taken for
granted and even passed over, not seeing
or not realizing the value of what life
was created to be, to have, to follow and
to one day be known for.

There is so much We want to talk
about through this little one because she
is Our Method, Our Means, and Our Love
to be able to speak through her and have
her repeat What We Will others to hear,
or to see, or to acknowledge, or to learn
about.

Thank you for taking My Notes,
because They were meant to not awaken
you, but alert you to the Importance of
Those of Us Who surround this little one
more times, more ways, than it is ever
understood to be."

Why? If every ham just wrote to their elected officials (for the cost
of a stamp, or free by email), they would get the message just as well,
if not better than, if they got 1 letter or a personal visit from the
ARRL "lobbyist".

Just my personal opinion, but I believe it is quite naive to think that
if "every ham just wrote". Extremely unlikely...and oh, if not the ARRL,
just who do you think is going to tell the hams to write and what to
write about?

Finally, it's quite naive to think that a national lobbying organization
is not helpful -- just look at how successful the NRA is.

All of you are also forgetting that the ARRL (for better or worse) is now the 'back bone' of the system that handles testing for ham licenses. Without them it would be almost impossible to find where you can locally take the test to apply for or upgrade your ham ticket. The ARRL also publishes most of the test guide material (though I would be surprised if it wasn't also available on line). Finally they have a good line of excellent technical publications on radio and electronics technology.

Also they DO offer membership without QST, for additional members of a family. Maybe the price of that will give you an idea of what they think the membership itself is worth.

Yes, and the blind can get a membership without QST for $8, same as a family member without QST. That was where I got my number from in another post in this thread.

Again, I am not suggesting anyone give up their membership in the ARRL.

The ARRL seems to have little to do with the most important part of
getting new hams, licensing.

The National VEC page, http://www.ncvec.org, apparently doesn't even
acknowledge the ARRL.

You have to search the site and get to Question Pool 3 to find the first
hint of the ARRL, and it's an email address for WY1O, who seems quite
dedicated and appears several more times. And he's all there is.

So much for making new hams.

Well, if hams won't take any initiative to write their Congressmen, then
they probably don't give two craps enough to really care if we lose
bandwidth. All proposed NPRMs are published in the Federal Register and
a simple search on their website for "FCC" will list them.
http://frwebgate.access.gpo.gov/cgi-bin/multidb.cgi

>
> Finally, it's quite naive to think that a national lobbying organization
> is not helpful -- just look at how successful the NRA is.

So, the ARRL is donating how much to political parties?

The NRA has donated a bit over $18 million from 1989-2010. They were
number 39 of the top 140 donors...
39 National Rifle Assn $18,209,746 17%(To Dems) 82% (To Repubs)
THAT'S probably why they are so successful. Money talks, BS Walks...

http://www.opensecrets.org/orgs/list.php

Didn't see the ARRL in the top 140. Searched and didn't find them on
the list at all. #140 donated about $4.7 million over the same period.

If the ARRL is so successful at lobbying, why did BPL go through even
though they begged members to send more money to fight against it and
lost the battle anyway? Remember when the 13cm band used to be
2300-2450 MHz? I do. Remember when the 1.25M band used to be 220-225
MHz. I do. Remember when a lot of foreign countries had no code
requirement for HF and we did? I do.

I'm not saying they aren't worth something, but why won't they give a
guy a choice about which magazine he wants with his membership?
Probably because QEX doesn't have so many ads as QST and they want the

advertisers to get more bang for their buck (understandably, since they
can charge more for ad space based on the number of magazine "subscribers")

Don't forget W5YI as a VEC. That's who I'm affiliated with, although
I'm not active with any VEC at present. They list VEs by state, so you
can find a local examiner.
http://www.w5yi.org/exam_locations_ama.php

The ARRL also
> publishes most of the test guide material (though I would be surprised

Yes, so I would almost say they are more in the publishing business than
the lobbying business.

>
> Also they DO offer membership without QST, for additional members of a

> the membership itself is worth.

So, can I just pay for membership and skip QST?

I believe they are required by the IRS to set a "value" on membership if
they are a non-profit. They are a non-profit, aren't they?

Huh? It's really not clear what you are saying. Have you visited the
ARRL web site?

Here are some of the sections they have listed relating to developing
new hams under the "Licensing, Education & Training" tab:

*FCC License Info & Forms

ARRL can provide helpful FCC information about licensing
requirements, forms, fees and regulations.

*Getting Licensed

Get the information you need to get started: find a class or
study materials and prepare for your licensing exam. Already licensed?
Take the next step and upgrade.

*Volunteer Examiner Coordinator

The ARRL Volunteer Examiner Coordinator (VEC) offers resources
for finding an exam session, becoming a volunteer examiner and VE Team
support.

*Volunteer Instructors/Mentors

*ARRL Courses & Training

ARRL training materials and online classes have been developed to
help you learn at your own pace.

*FCC License Info & Forms

ARRL can provide helpful FCC information about licensing
requirements, forms, fees and regulations.

*Get on the Air

You've got your license, now what? Find resources to help you set
up your first station, get on the air and have fun! Learn More

Volunteer opportunities, recruitment and unique ways to support
Amateur Radio advocacy.

o Amateur Radio in the Classroom

This sure seems like a lot of stuff for a group that you claim is not
supposed to be interested in beginners.

> The National VEC page, http://www.ncvec.org, apparently doesn't even
> acknowledge the ARRL.

Again, huh? This site is "unto themselves". They don't seem to
acknowledge ANY group except themselves. Sorry, but IMHO, a totally
bogus point.

> So much for making new hams.

One more time...Huh?

They DO have a VE program (I AM one), they have an Educational program
to bring ham radio to kids in the class room, they set up space station
contacts for kids in classrooms, they have a Volunteer Instructor
program to teach people how to be instructors for training new hams,
they have volunteer mentors, almost every article in QST has a
"Hamspeak" section to explain unique ham terms to beginners.

Finally, what makes you think they don't want new hams? It would be in
their best interest and longevity to have more new hams. Why would they
shoot themselves in the foot by not wanting new hams?

The only thing that IS clear to me is that you have not read QST in a
long time, have not been to their web site in a long time and seem to
have a real grudge against them for whatever reason (certainly your
prerogative). But you DO demonstrably have your facts wrong about them
doing nothing to encourage new hams.

I would respectfully suggest that you visit their site, arrl.org, and at
the main page choose the "Licensing, Education and Training" tab to see
just how much they ARE doing to cultivate new hams. (Admittedly a tough
job in the Internet Age, but contrary to what you are saying, they ARE
trying).

73,
Joe

IF The ARRL want to have a real "Voice" at the Table
in Congress and at the FCC :Then they have to be as
'smart' as the other "Players" in the Washington, DC
Political 'Action' {Power} Game.

Look At Success : Look at the NRA Political Victory
Fund (NRA-PVF) : http://www.nrapvf.org/

You have and build your 'basic' ARRL Membership
-roughly- 155,000 ARRL Members
http://www.arrl.org/membership

+ Plus you have to have and build a supporting
{Independent} "Voice of Amateur Radio" PAC Fund

The ARRL has enough Members who are Lawyers
set-up and make a "Voice of Amateur Radio" PAC
Fund Do-Able and Work-Able -so- Just Do It !

Encourage Each ARRL Member to make a
Matching {Voluntary} Contribution to the
"Voice of Amateur Radio" [VoAR] PAC Fund
-so- Take the 155,000 ARRL Members
-by- $5 = $775,000 VoAR-PAC Fund : Figure about
20% for a Part-Time Lobbyist and leaves around
$1000 in 'political' contributions per Member of Congress
-by- $10 = $1,555,000 VoAR-PAC Fund : Figure about
20% for a Part-Time Lobbyist and leaves around $2000
in 'political' contributions per Member of Congress

? Is Your Amateur [Ham] Radio "Hobby" Worth an
Extra $5 to $10 per Year To You For A Seat At The
Table of Congress and the FCC in Washington, DC ?

Promote the "Voice of Amateur Radio" PAC Fund
to the American Public and the Corporate World
Git Them To Become Sponsors and Underwriters
of the "Voice of Amateur Radio" PAC Fund too.

Then Use the "Voice of Amateur Radio" PAC Fund
Money to Lobby Congress and the FCC to ensure
Fairness and Equal Treatment for Amateur Radio
in Congress and Before the FCC.

It's All Legal & It's All Good - it's very smart too ~ RHF
.
REALITY CHECK : WITH ONLY 155,000 MEMBERS
THE ARRL HAS THREE GOALS :
1st : Build Membership and Increase the Number of Hams
-or-lose-spectrum-and-vanish-from-the-air-waves-
2nd : Build Membership and Increase the Number of Hams
-or-lose-spectrum-and-vanish-from-the-air-waves-
3rd : Build Membership and Increase the Number of Hams
-or-lose-spectrum-and-vanish-from-the-air-waves-
.
.

The NRA has spun off an entire "separate" organization to do that, since
the tax status of the basic organization doesn't allow it.

The NRA also has about 4 million members; how many does ARRL have?

http://www.nraila.org/

BPL has NOT "gone through."

The ARRL DOES lobby in D.C. - Chwat & Co., Alexandria,VA
Plus direct HQ access to the FCC commissioners and staff.

Your contributions are regularly requested, plus the most effective,
personal letters to our representatives.

"non-profit" organizations do have restrictions on how money is spent,
e.g. no money to political campaigns, etc.

W5MTV --- Hence "Look At {Better} Success" :
Look at the NRA Political Victory
Fund (NRA-PVF) : http://www.nrapvf.org/

The Are More and Bigger Challenges To Amateur Radio Then
Just BPL : Such As Lose of RF Spectrum and Radio Bands.
http://www.arrl.org/files/file/Hambands_color.pdf

Simple Fact : With just 155,000 Members the ARRL
is a relatively 'small' Constituency Group for anyone
Congressman or Senator; and the US Congress as a
whole; as contrasted to :
* NRA ~ 4 Million Members [25X ARRL]
* AARP ~ 40 Million Members [250X ARRL]
Both of Which Claim To Be "Non-Profit" Organizations too...

Again I Simply Posse The Question :
Why-Not ? : A "Voice of Amateur Radio" PAC Fund !
http://groups.google.com/group/rec.radio.shortwave/msg/15807e1c0a01df1c
.

What hams need are wealthy, high-profile members - like the NRA and AARP. They may be small, but fascinating people, even if they are stooges, can yield results.

So you need a dozen younger Barry Goldwaters ?
or a 2nd organisation same as here because the incumbent are hopeless

882. Tower hinge, would this work?

Newsgroup: rec.radio.amateur.antenna
Date: 2011-04-20 15:58:08 UTC
From: stryped <stryped1@yahoo.com>
Message-ID: <657ca43c-a9e9-4e9b-b701-7ab4862c19f7@z33g2000vbk.googlegroups.com>
Source record: 5183

My idea is to make some sort of hinge so I could lower it over and raise it. I know I mentioned it before but now seems to be the time I need to do it. (My little boy is starting to find pieces of the antenna in the yard.)

My thought was to dig a hole beside my current antenna a couple of feet deep and in circumfrence. Place some 3 inch schedule 80 pipe (one
for each corner) into the holw with a 2x2 or so piece of 1/4 inch steel on top. On the end of the plate would be welded a few pieces of black pipe the diameter of a hitch pin. There would be another piece of 2x2x1/4 piece of steel with more black iron pipe on it. The black iron pipe would in effect be the "hinge" part of the mechanism. (sort of the way I made the fold down gate for my trailer).

Here is where I am having trouble. On top of the "top" plate, I have some 2 inch black iron pipe. My first thought is two weld three of these as "legs" on top of the top plate, then put my cut down exisiting tower into this pipe, drilling a hole through each leg. (The
new two inch pipe and the legs on the tower). Instering a grade 5 bolt
into this. I have also thought, I wonder if it would be easier to just
put the three legs up and use u bolts to attach the tv tower to the outside of the legs.

I would still need to climb part way up it or have the capability to to adjust my sat dish. I cant figure out a good way to do it with the tower leaned over.

Really cant get my head wrapped around most of the discription but two
feet in the ground for the supports probably isnt enough. We have a
30ft tower at work with a pretty light load Omni UHF antenna and it is
8 ft in the ground.

Jimmie

I assume you meant " part way up to have ...", so I'll offer an approach to the satellite dish portion: You can make a very accurate angle finder, irrespective of whether the tower is upright or tilted. I did it virtually free.

Photocopy a protractor or print an Internet graphic of one and paste/tape it to a smooth flat surface. For mine I used a waste chunk of half-inch pine and the size -- 180 degrees' worth of arc -- is about ten inches. I printed it up to that size on standard paper.

Paste the protractor so the vertex (the point from which the angles originate) is on one edge of the board. Hang a weighted string from the vertex. (I used dial cord; it's strong, smooth and thin.) When the board is held vertical, the angle of the top or bottom edges of the board are indicated by the angle mark crossed by the string.

The string is only a tenth of a degree wide so you figure I can set angles pretty well using this crude, clunky device. (I used it to install a C-band dish in the 1980s; I got elevation perfect the first time and azimuth within a quarter-degree.)

Given that one picture is worth a thousand words, I have a graphic I drew. I'm having trouble uploading it to my web provider but I will email it to you if you like. You can post here or directly email your interest to me at the "sobars" email address you see for me at cox.net.

73,
"Sal"

Call a fiberglass place and get a cheap resin/hardner and fill in the center.
Anything you don't want it to stick to, use vaseline. A pint of the r/h should do it.

890. OT? Wireless Xmtr/Rcvr For Sports Scoreboard

Newsgroup: rec.radio.amateur.antenna
Date: 2011-04-23 03:21:29 UTC
From: DerbyDad03 <DerbyDad03@eznet.net>
Message-ID: <iotgjj$vr3$1@speranza.aioe.org>
Source record: 5191

I might be asking my question in the wrong group, so feel free to send me packing if I am.

The background:

Our high school just installed a scoreboard for our new Varsity Softball field. The scoreboard controller talks to the scoreboard via a cable that has a 1/4" TRS plug on each end.

http://www.planetronic.es/images/ak2563.jpg

One end plugs into the controller and the other end plugs into a jack that is wired to the scoreboard in the outfield.

Unfortunately, they didn't ask anyone involved with the team which dugout would be the home dugout, and they installed the jack that the controller plugs into in the visitor's dugout.

We are currently using a 20' cord so that the operator doesn't have to sit in the visitor's dugout...he sits outside the dugout, but is still on the visitor's side of the field.

We'd like to move the operator to our dugout, but we can't get the school to move the jack until after the season is over.

The question:

Could we use a wireless transmitter and receiver in place of the cord? If so, we could put the receiver in the visitor's dugout and plug it into the socket and the transmitter would plug into the controller. The range would be under 100' and the dugouts are made of concrete.

The problem is, I don't know where to start looking for this type of equipment, or even what I would need to know to spec it out.

Any suggestions would be appreciated.

Thanks!

This group is about antennas used in the Amateur Radio service, aka ham
radio.

Why not just make a 100-foot cord for the controller?

Thanks for the response.

While the straight line distance is about 100', the physical distance for a cord would be about twice that in order to go around the backstop.

Then there's a walkway to deal with, players with spikes, etc. While a longer cord will certainly work, I'm just wondering about alternative solutions.

You need to find out what kind of signals are carried over the cable?
Is it some sort of serial data (very likely)? If so, then you should be
able to find some sort of wireless data link that can handle the data
rates and formats.

What does the scoreboard manufacturer offer? (This has to be a
reasonably common problem..)

894. Transmitter Output Impedance

Newsgroup: rec.radio.amateur.antenna

This group has presented members with valuable lessons in antennas and transmission lines, like how to measure, how to match, etc.

Something I haven't seen is a discussion of the source impedance of the transmitter. My curiosity was piqued today as I took some baby steps into EZNEC. A particular antenna had such-and-such VSWR if fed with a 50-ohm cable and a different value if fed with a 75-ohm cable.

While this is hardly news, it got me wondering whether a 75-ohm cable will load the transmitter the same. Doesn't seem like it.

My point: Using 75-ohm cable to improve the match at the antenna won't help me ... IF ... I suffer a corresponding loss due to mismatch at the back of the radio. My HF radios, all solid state, specify a 50 ohm load. As necessary, I routinely use an internal autotuner and either of two external manual tuners. (I'm aware of the published 1/12 wavelength matching method.)

Wisdom in any form would be appreciated. Thanks.

A transmitter output impedance is designed for maximum power transfer at a specific impedance. Most of the the older tube transmitters impedance was tunable within a range.

In simple terms the impedance of the transmitter tube is the plate voltage devided by the current. This impedance is then transformed to the nominal 50 ohms of the antenna system. If the transmitter has the usual tune and load controls, the exect impedance will not mater as you adjust for maximum transmitter output.

Most of the transistor transmitters are not adjustable so the output impedance is usually fixed at 50 ohms for maximum power transfer. If the impedance of the antenna system is not 50 ohms, then the output power will be less than the designed output. You can use the antenna tuner to adjust for a match.

I suspect that most ham transmitters do NOT have a 50 ohm output impedance. What they do have is a specification that they will adequately drive a 50 ohm load (and some sort of internal circuitry that detects an "unacceptable" output condition and turns down the drive).

After all, your transmitter could have an output impedance of zero ohms (a "stiff" voltage source), and adequately drive your transmission line and antenna at 50 ohms (yes, this is not the optimum power transfer, but nobody ever said that ham transmitters are designed for optimum power transfer... maybe they're perfectly happy with less transfer, but still operating within their safe area)

ON9CVD made some simple measurements using a couple of resistors and foudn that a TS440 has a Zout somewhere around 15-40 ohms (depending on frequency and output power).

Hi OM,

Look at the prospective SWR and how much is
lost/reflected/absorbed/what-have-you? More heat comes from a less
than optimal system efficiency than what your computation will reveal.
So much that it will swamp it.

But the trick here is that the reflected "power" (arguments turn on
this word) doesn't always mean heat and it could actually cool -
however hot or cold it may alter the situation, that same "power"
never got out into the air.

Now, as for source impedance, that is a subject fraught with denial in
the face of the obvious: Those fins in the back of your rig are to
help bookend your QSL cards into groups (the heat bears no relation to
efficiency nor match loss).

A standard definition (courtesy of Wikipedia) for Return Loss is:
where Zs is the impedance toward the source and
Zl is the impedance toward the load.
and we find from the values you supply that it is
0.20

Of course, such a definition is utterly useless when the concept of Zs
is replaced with (in most cases) "it ain't 50 Ohms, thet's fur
shure").

If, perchance, some brave soul steps into the breach of NOT 50 Ohms to
suggest what Zs is, then we can give it the acid test of engineering
(an act that I am usually reminded is beyond the understanding of
readers and the province of discussion here). Let's be gentle and go
only by an order of two (which is reasonably available and can be
coaxed out of my TS-440). Return loss for a rig exhibiting an Zs of
25 Ohms into the 75 Ohm line (presuming it is infinite in length)
would give us:

0.50
that doesn't look good, so let's try Zs of 100 Ohms:
0.14
that looks better all 'round. Even intuition agrees.

Let's press intuition to the proximal limit and say that Zs is 74 Ohms
(yes, my thumb is on the scale):
0.01

What does intuition affirm? What is preferable?

Hello Sal,

Make yourself up for a long discussion (as we had such a thread
earlier).

Most amplifiers are designed just to provide the desired amount of
power into a certain load. The actual output impedance of the
amplifier is not important in many cases. Changing the load impedance
(for example in case of a solid state amplifier) may result in less or
more heat generated in the active device(s). You can see this by
changing the load (for example with an external matcher between power
meter and PA) and watching the output power and current consumption.

If you have an amplifier with tunable output section (vacuum tube PA),
you are within the range of the tuner, and you tune it for maximum
output power (given certain drive), the output impedance equals the
load impedance (or conjugated value in case of non-ohmic load). If
you change the drive (so adjust the output power), the output
impedance may change (due to saturation issues). Same is valid for the
load, if you change the load, voltage across and current through the
active device may saturate, hence changing the output impedance.

Non-tunable amplifiers (for example a 3…30 MHz balanced amplifier) will mostly not present 50 Ohms to your load (unless specially designed for that using feedback).

Virtually all high-efficient switching amplifiers do not show 50 Ohms to the load. If you add an external tuner and match to maximum output power, you will very likely destroy the amplifier in case of no supervisory circuits present.

You can do some experiments with your own amplifiers. Just change the load impedance and see what the forward power indicator on your reflectometer/VSWR meter does. If it doesn't change, your output impedance is very close to 50 Ohms.

Measuring the output impedance (for relative small change in load) is possible, but is not a simple task. Very likely other people will comment on this.

With kind regards,

Wim
PA3DJS
www.tetech.nl
without abc, PM will reach me very likely.

Not exactly..

A "match" provides the optimum power transfer from generator to load, but that is NOT the maximum load power, nor is it either the maximum or minimum power dissipated in the source.

Say I have a zero output impedance on my source and I'm putting out 7 Volts RMS into a 50 ohm load. That's about 1 watt into the load. Now.. if I reduce the load impedance to 25 ohms, and since I've got zero output impedance, I'm now putting out 2 Watts. The source impedance is zero, so I'm not dissipating any extra power in the source, either.

It is true that a "matched load" to my zero ohm source would, in fact, be zero ohms, and would have infinite power. Any other load impedance would have less power into the load, so the Thevenin theorem is satisfied.

Now.. if my generator had a fixed output impedance, it's true that the load impedance that will get the most power out is the conjugate of the output Z. For resistive sources/loads, here's an example..

You also have to be careful about looking at Thevenin equivalent sources (e.g. a ideal voltage in series with a Z, or a ideal current in parallel with a Z), because just because *the model* has a resistor in series does NOT mean that you're actually dissipating any power in the source. (If I had a very efficient op amp, I could simulate any arbitrary output impedance, without dissipating any power in the source)

Say my generator is 40 ohms, and I'm putting out 7 Volts into a 40 ohm load. OK, that means that the imaginary voltage source is putting out 14 V. I'm getting about 1.23 Watts into my load. Now, if I decrease my load Z to 20 ohms, what do I get? Now, I have 4.67 (=14/3) Volts instead of 7, and I get 1.1 Watts. Yep, less.. Thevenin works. Let's try increasing the Z to 60 ohms.. Now the voltage on my load is 8.4 V, and I'm dissipating 1.18W, again, less than my 1.23.

But here's some weird stuff.. let's look at how much power is dissipated in that imaginary resistor (i.e. our source *really is* a ideal voltage source in series with a resistor)

At 40 ohm load, we've got 7 volts on the load and 7 volts across the resistor, so they both dissipate the same 1.225 Watts. Pload/Pgen = 1

In the 20 ohm load case, we've got 1.1 dissipated in the load and 2.2 dissipated in the generator. Pload/Pgen = 0.5

In the 60 ohm load case, we've got 1.18 dissipated in the load, and 0.78 dissipated in the generator. Pload/Pgen = 1.5 (i.e. we dissipate more in the load than in the generator... how about that!)

And let's look at "efficiency" of the system (assuming that the total power in is the sum of what's dissipated in the generator and the load)

20 ohm load, 33%
40 ohm load, 50% (what you'd expect)
60 ohm load, 60% (hey.. it's more efficient, too)

-> take home message... a "good match" is sort of an artificial thing from a power transfer standpoint.. it depends on what you're trying to optimize for.

-> Where you get bitten is when "match" varies with frequency... now, all of a sudden, you have a system that has a response that varies with frequency, which is generally undesirable. When you get up into the microwave region, where a transmission line is often many wavelengths long, that mismatch can result in remarkably wild fluctuations in gain with respect to frequency.

ON9CVD's website I linked to has a very simple technique.. 50 ohm dummy load and a 220 ohm resistor you can switch in.

At 100W (into 50 ohms), the 220 ohms would only dissipate 22W. You could get some of those non-inductive resistors from Caddock and series them up to do something like this.

BTW, this is a simplified version of what's called a "load pull" test... which makes me wonder if one could cobble up a quick test set that could be controlled by a computer to do automated output Z measurements of an HF transceiver over a reasonably wide range... One approach would be to use a RS-232 controlled antenna tuner and, maybe, a antenna relay box with several different load resistances).

The challenge (having actually looked at doing this with a LDG AT200PC) is that the Z of the tuner isn't very well defined. It's a pretty big calibration project in itself.

Maybe, though, one could build a few test dummy loads.. say a 25 ohm and a 75 or 100 ohm, along with your vanilla 50 ohm, and the antenna switch (like an RCS-8V). Basically, you're building a "high power resistor substitution box"

You'd want some sort of nice inline watt meter (like an LP100) to make the measurements.

Yes, consider a source with 70.7 volts at its output terminals
connected to a 50 ohm load through a 50 ohm feedline. Except for
source efficiency, the source impedance simply doesn't matter. Any
70.7 volt source will deliver 100 watts to the feedline no matter what
the source impedance.

There's a simple method called load-pulling. Keeping everything the
same at the source, if the power to the load increases when the load
is changed away from 50 ohms, the source doesn't have a 50 ohm
internal impedance.

Hello Ralph,

The actual output impedance can be anything, but is mostly not 50 Ohms. If you want it close to 50 Ohms, you have to spend money in components and design time. As 50 Ohms isn't mostly required, one will not design for that.

Just as an example, take a hard-driven totem pole or push pull stage with only a series tuned circuit to suppress harmonics (so the LC circuit shows zero ohms at the carrier frequency). As the active devices are used a switches, the output impedance of this arrangement is almost zero (at least far below 50 Ohms).

When you connect a 50 Ohms quarter-wave cable between the output and the 50 Ohms load, the amplifier-cable combination has very high output impedance (quarter wave transformer formula).

For power amplifiers, there is no relation between actual output impedance and efficiency. When an amplifier is designed for 50 Ohms, it only means that the amplifier will work correctly when terminated with 50 Ohms. When you deviate from that, output power may decrease or increase. This may result in more or less stress on the amplifier's components.

With kind regards,

Wim

Thanks Richard. Intuition is that the Zs is near 50 ohms for as many frequencies as the designer can manage. I am on record (including in this group) of letting intuition lead me down the path to ruin.

I get from you that there's a presupposition that I know the source impedance or can easily establish it. Hm-m-m ... not so. One big problem I see is the need to try to measure power delivered in a non-50-ohm system with my existing instruments that depend on a 50-ohm system. I don't have a nominal 75-ohm power meter. Won't putting a 50-ohm meter into a 75-ohm circuit not only read wrong but introduce reflection losses, too?

I think I'd need a collection of non-inductive load resistors and an accurate rf ammeter. I'd need to connect them and calculate power at a few points in every band.

Maybe the papers that Cecil cited for me will fill in the gaps or suggest other approaches.

I can see why this is parenthetical, because it covers a lot of sins
of omission.

First we bang up against the wall of Gain Bandwidth Product. If you
are talking about resistive loads at low power DC, then your statement
is trivially valid.

Second, the ability to "simulate" any arbitrary output (or input for
that matter) impedance for an OP AMP is well defined in the closed
loop gain (which robs from the open loop gain for frequency by
proportion to GBP).

Taking the conventional RF Power Deck of any consumer (Ham) product,
the similarity to an OP AMP is wholly foreign, and for good and
commercial reason. If one were motivated to engineer in the necessary
noise amplifier (a term coined by H.W. Bode who defined this topic of
source Z and applied it to the negative gain or feedback path); then
we would find that the exact same loss is exhibited in the exact same
component(s).

However, by virtue of OP AMP characteristics we would benefit to
vastly better distortion figures, far less spurious content, and
virtually no need for either the conventional impedance transformer,
nor the bandwidth filter that follows the same power deck (provided,
of course, that the drive input is sinusoidal - which it never is,
unfortunately, for this scenario). This novel OP-AMP/Power-Deck
redesign would also confer considerable power supply rejection (that
voltage could sag or rise without appreciable effect) and noise
rejection (the internal noise from other circuitry would not migrate
into the signal output). ALL such benefits are strictly derived from
the amount of negative feedback (not to be confused, as are many
readers to this topic, with the rather ordinary compensation cap in
the last stage).

Why isn't this done as a service to the customer?

Cost.

Again, OP AMP design merits are paid for in lost gain and bandwidth.
The price is found in the amount of negative feedback that goes to
lower the overall amplification. Would you pay for this improved cool

performance to run 10W in the 80M band from a formerly crackly and hot
100W 10-80M band capable source?

Hello Jim,

Other method is injecting a slightly off-carrier frequency signal into
the amplifier (this emulates a constant small VSWR shown to the PA
(wtih 50 Ohms load), but with continuous varying phase). Because of
the difference in frequency, one can measure the forward (towards the
PA) and reverse (reflected by PA) signal with a two channel VSA.
This will give you the PA's complex output impedance.

Tom (K7ITM from my head) did this with a HP89410 with couplers.

With kind regards,

Wim

Well, if you miss the path, you are certain to be reminded where it
is.

>I get from you that there's a presupposition that I know the source

It is printed in the specifications. There are other ways to derive
it, of course, and they would merely confirm that number.

It is easier to measure voltage and current and use your calculator.
Now having said that, measuring voltage and current is damned hard at
HF. It is achievable with care, but now we are back into your same
question with many hands pointing at that path to ruin.

As both are difficult (power or voltage times current), you could
trust authority (which confirms what is intuitive), or you could
listen to argument (which at the distance of time and recall becomes
murky and opaque).

>I think I'd need a collection of non-inductive load resistors and an

Bravo! This reduces complexity because RF Power resistors of high
accuracy and bandwidth are commercially available. You will need to
practice your skill at mounting to a heat sink, however (another
non-trivial achievement).

>Maybe the papers that Cecil cited for me will fill in the gaps or
>suggest other approaches.

Walt and I have been corresponding over these matters just these past
two weeks. Skimming that content will once again confirm intuition.

yep.. not possible to build such a thing, anymore than one can build a
zero ohm output impedance RF source with any signficant power.
Suggested more as an example that the power dissipation in the source
doesn't necessarily correlate with match, load Z, or anything else in
general.

(You can get pretty darn close at powers less than a watt and HF, though..)

One can also do a lot of this with various clever schemes if the input
to your PA is coming out of some signal processing. Generically,
predistortion, but it can be so much more.
People have literally spent their lives working out ever more
sophisticated approaches

Yes.. that's another way to do it.

I think one would want variable load impedances for the testing in any case, because I'll bet that most ham rigs have a load dependent Z.

I've occasionally kicked around the idea of what would it take to do it simply, especially with nifty devices becoming available to help with the measurements.. $500 VNAs, $400 power meters that directly read current and voltage, etc.

What I'm not sure about is whether it is "useful" to know. Consider a ham with a manual or auto tuner. They'll adjust for minimum reflected power, which is probably as good as anything else. Hams, as a class, don't much care about "DC power to RF radiated" efficiency (because the regulatory requirements are imposed at the "RF output" measurement plane..

Power dissipation in the PA is only a second order concern.. can I plug it into a standard outlet? Will it get too hot in my car?

backpack QRPers are concerned about DC power consumption, but I'm not sure they're worried about whether their PA is 30% or 35% efficient.

The people designing battery powered tracking transmitters ARE concerned about this, as are high power broadcasters (since they're both directly paying for the supply power and have a "radiated RF power" requirement to meet their need).

You might want to consider moving this across to
rec.radio.amateur.homebrew or similar, this is more to do with the
antennas rather than the devices producing the signals themselves (the
transceivers).

> rates and formats.

In other words, my approach; make up a cable that allows you to access
all three conductors between the plugs, and use an oscilloscope to
identify the signals and signalling rates. Given the distance I
wouldn't mind betting it'll be something along the lines of RS485. I
doubt they'd try SPI or RS232 over that distance.

> What does the scoreboard manufacturer offer? (This has to be a
> reasonably common problem..)

+1... before you potentially void warranty. There's likely a 2.4GHz
or 433MHz solution out there that will work and will be suitable for
your local areas radio spectrum bandplans.

OP AMPs are a constant of my admiration in the possibilities offered.
That and the signal processing you suggest (plus digital oscillators)
"could" change the playing field - if conventional design weren't so
universally fallen back upon.

Unfortunately, the impedance encountered by the off-carrier frequency
signal is probably not the same as the impedance encountered by the
carrier frequency so the results don't correlate and are not very
useful. The carrier frequency has interference components that the off-
carrier signal doesn't encounter.

I agree with Jim. While it's true that if a source (transmitter) is tuned for maximum output, the output impedance must necessarily be the conjugate of the load impedance, it is NOT generally the case that the transmitter is tuned for maximum output. Rather, the transmitter is tuned for an output that won't destroy the output devices and will result in acceptable distortion (in the case of a linear amplifier). There are plenty of cases of sources designed to be loaded with an impedance far different from their output (source) impedance: the AC power line, audio amplifiers, ...

A while back, I set up a couple precision high power directional couplers so I could measure the output impedance of a couple different ham rigs. In the case of the rig with vacuum tube output stage, if I operated the output stage with limited grid drive and tuned the plate tank for maximum output power, indeed the output impedance was 50 ohms, within the tolerance of my ability to adjust the output for maximum. But if I increased the grid drive for solid class-C operation and tuned for the rated output power (which is no longer the maximum possible power), the impedance seen at the output dropped. If you work through the pi-network transformation back to the vacuum tube plates, it's apparent that the plates under those operating conditions represent a considerably higher source impedance than when things are tuned for maximum available power (as first described).

But coming back to "Sal's" original question, it's always made sense to me given the availability of inexpensive 75 ohm line with low loss to go ahead and use it to feed antennas that have a feedpoint impedance closer to 75 ohms than to 50 ohms. If you need to provide a bit of matching at the transmitter end so that the transmitter is operating correctly, it should be straightforward to do that. But whether the actual source impedance of the transmitter is one value or another is really of very little importance. The only time I can think that it would matter is if you're trying to transmit a very broadband signal and you don't want power that's reflected at the transmission-line:antenna interface to re-reflect from the transmitter:transmission-line interface and go back to the antenna, delayed by enough to cause a "ghost" (in a television picture), for example. In such a case, you'll be well served by insuring that the antenna is well matched to the transmission line so there is an insignificant reflection there anyway.

Cheers,
Tom

> PA3DJSwww.tetech.nl

Yep, 'twas me. Using the 89410, I can resolve a signal removed from the transmitter's output by a very small frequency offset, so it's well within the bandwidth of the transmitter. With synchronous averaging, the injected signal could be one or two Hz away from the transmitted carrier, though it helps a lot to have a transmitter running from a really "clean" (low phase noise) source if you're going to do that. The injected signal can be many tens of dB lower in amplitude than the transmitted signal. As I recall, I was using a signal a kHz or so away from the carrier, still well within the bandwidth of the RF power amplifier. One thing you have to be careful about is either disabling ALC, or operating well outside the ALC loop bandwidth; you don't want the ALC screwing up your results.

As Wim points out, this setup presents a load to the RF power amplifier that's indistinguishable from an R+jX load that's continuously varying, tracing a path around a little circle on a Smith chart (a very tiny circle, when using signals that are very small compared with the transmitted power). The rate the circles are traced out is just the frequency offset between the transmitter and the test signal.

Cheers,
Tom

Helo Cecil,

Depending on the frequency resolution of your VSA, the frequency of the injected signal can be well within 1 kHz of the carrier, so LC filters in the PA will not distort the measurement. In case of a 100W PA and injection of about 100 mW, the difference in wanted signal and signal to be rejected is 30 dB (not that large).

If you don't have a VSA, you can still do it (with some more calculations) by using a diode detector, this will give you the difference frequencies directly and you can observe the phase differences on an oscilloscope.

There can be a difference between a very slow load variation (for example manually changing loads and noticing current and voltage [including phase]) and the VSA method. This is because of decoupling capacitors in the power supply or bias circuits (for example RC combination in the grid circuitry to limit the grid current). If you vary the load about 10..100 times/s, bias and supply voltages don't have the time to settle to their steady state.

If the VSA method is basically wrong, I would love to hear why.

With kind regards,

Wim

Not knowing the nature of the signals on the cable makes this a
problem. Im betting it audio. Perhaps a wireless mike TX/RX
combination may solve your problem. If its digital there are RF MODEMS
available.

Being aware that this was the nature of my solidstate transceiver I attempted to use a tuner with one to improve my match to my antenna system. While I didnt damage my transmitter I did notice that the best settings of the tuner for TX and RX did not coincide. I was wondering if anyone else has observed this .

Would any competent optical physicist suggest that it is valid to
study the conditions associated with interfering coherent light waves
inside an interferometer by introducing an incoherent light source
into the system? Why would any competent RF engineer suggest that the
system source conditions associated with interfering coherent RF waves
can be studied by introducing an incoherent test signal?

Hi Jimmie,

This is somewhat cryptic, you would be expected to need a tuner.

>While I didnt damage my transmitter

This transcends cryptic. It's like saying that as you came to a stop
sign, you used your brakes and you didn't damage your car.

>I did notice that the best
>settings of the tuner for TX and RX did not coincide. I was wondering
>if anyone else has observed this .

Two different circuits inside, hence two different loads. Two
different loads, hence two different matches. Some receive paths
might be 50 Ohms, but that value is not as essential as for
transmission.

As this slightly off-carrier frequency signal behaves like a load with
very low VSWR with a cable in between that extends with constant
speed. In other words, the amplifier sees a constant VSWR, but with
changing phase. Small frequency difference results in slow phase
change of VSWR.

Maybe you should read the postings from Tom also (K7ITM)

Hello Jimmie,

I noticed this also when I was experimenting with CB equipment and simple antenna experiments.

For several CB transceivers I could get more output by slightly mismatching the load as seen by the PA (but in many cases with too much increase in current consumption).

I tried to use a matcher/tuner (and later a high Q resonator) to reject other stations close by and then I figured out that when applying mismatch to the receiver, the S-meter moved further.

The above isn't strange. As PA's are mostly not designed to show 50 Ohms, many receivers are also not designed to show 50 Ohms. I am not discussing wide band receivers (for example digital or analog video).

Most active devices have lowest noise figure when driven from a source impedance that is far from the input impedance of the active device. If you want them to be equal, you need to use feedback and that complicates the design.

Also filters with significant pass band ripple show, even when designed for 50 Ohms, significant input reflection when referenced to 50 Ohms

With kind regards,

Wim

From the IEEE Dictionary:

"impedance -

(1)(A) The corresponding impedance function with p
replaced by jw in which w is real. Note: Definitions
(A) and (B) are equivalent.

(1)(B) The ratio of the phasor equivalent of a steady-
state sine wave voltage ... to the phasor equivalent
of a steady-state sine wave current ...

(1)(C) A physical device or combination of devices
whose impedance as defined in definition (A) or (B)
can be determined. Note: This sentence illustrates
the double use of the word impedance ... Definition
(C) is a second use of 'impedance' and is independent
of definitions (A) and (B)."

The pinging experiment seems to be measuring a physical impedance (1)
(C) the nature of which is unclear. When the amplifier is outputting
power, it seems that the source impedance would be a V/I ratio (1)(B)
which doesn't respond to incoherent signals. Seems to me, you guys are
pinging something other than the source impedance.

Not surprising at all.

Consider the whole black art of adjusting the input match for lowest noise figure, which may or may not coincide with the largest output signal for a given input.

All those theorems about matching always have an asterisk about the assumption that they're reciprocal linear devices with constant impedances, etc. Start putting nonideal active devices in the mix, and life gets interesting.

Interestingly, it's NOT an incoherent test signal. It's a carefully
chosen coherent test signal with a frequency difference. It's the same
idea as having an interferometer with dithering piezo transducer on a
mirror or a modulator in one of the paths.

to the device under test, this isn't much different than a electrically
controlled line stretcher (a classic automated load pull setup... see
the stuff from Maury Microwave, for instance)

It's a very clever technique. A variant is used in antenna ranges where
you have a probe with a mismatch in it.

Hello Cecil,

You may try to figure out how the signal injection method functions
(it is a form of active load pulling).

Can you agree with:

it doesn't matter whether:
-power reflect towards the amplifier is caused by load mismatch, or
-power is sent towards the amplifier by means of a phase synchronized

source.

This source is phase synchronized with the PA's exciter, so we have a steady state system.

We assume small load mismatch (or low injected power towards the PA) so that the operating point of the PA just changes slightly (to allow linear approximation).

Now we insert a coupler between the amplifier and the load. This coupler will measure the forward voltage generated by the PA, plus the reflected part of the voltage that originates from the phase synchronised source. Depending on the phase relationship, it can be more or less then the forward voltage of the PA. If the PA shows 50 Ohms, the coupler's output would not change due to the signal injection (as no signal is reflected by the PA).

We note the forward coupler's output voltage (both phase and amplitude).

Now we change the phase relationship between the exciter and the source that transmits some power toward the PA. Lets change 180 degrees and keep the amplitude the same. We again note the coupler's output voltage (both phase and amplitude).

The voltage that is reflected by the PA equals half the complex voltage change because of the phase change. Off course you have to correct the readings because of the coupler loss. If you know the signal that is send toward the PA, you can now calculate the complex output impedance of the PA for small load change around 50 Ohms.

Instead of changing the phase of the source manually, you can do that continuously and note the couplers output continuously. If you change the phase of a signal continuously (with certain constant rad/s), the result is a decrease or increase of frequency.

Assuming some reflection by the PA, the complex output from coupler rotates around a certain point. That certain point is the result of the PA's output power and the rotating vector is the result from the injected signal that is reflected by the PA (back towards the load).

With a VSA you can discriminate between the voltage component from the PA itself and the reflected component (with slightly different frequency). With a normal spectrum analyser, you can only determine the magnitude of the PA's reflection coefficient (or VSWR as you like). Given the dynamic range of today's equipment, you can inject a very low level signal that may mimic load mismatch well below VSWR = 1.1.

With respect to the impedance concept, we as amateurs do not use steady state signals, as they contain no information. We modulate them and are still using the impedance concept, despite the definitiones you showed.

As long as the signal that is injected is well within the pass band of the PA and it sufficiently low to allow linear approximation, the concept of superposition and concept of impedance still holds. But if you feel more confident with the manual phase change, or using two known loads with known slight mismatch, I have nothing against it. But if you have a VSA, some couplers and signal source at hand, it may save lots of time.

With kind regard,

Wim

One needs to have an analyzer with a narrow band detector for this, though.

Inexpensive analyzers like the TAPR VNA have untuned detectors, so the
PA's main signal will screw things up.

The N2PK uses a form of direct conversion detector, so your test signal
would have to be far enough away from the main signal so that the LPF in
the detector filters it out. The original N2PK design uses, I think, a
100 Hz filter, and the adc samples at 15.36 kHz with a digital filter.
The overall BW is something like 5 Hz, so putting your test signal 1kHz
away would probably work.

Thanks Wimpie.

It sometimes takes a bit to get me to realize this type of thing isn't hard, it's actually simple. My old brain tries to obfuscate things from itself sometimes.

It Calc 100. Make the difference small.

Cordless phone?

Feed the signal from the cable into a modem, then into the phone handset. Base station demodulates the audio back to digital and feeds the cable to the scoreboard.

Trouble is, the impedance in IEEE definition (1)(B) doesn't *cause*
reflections. If the actual source impedance matches IEEE definition (1)
(B), the presumption that source impedance will *cause* a reflection
is invalid.

Walter Maxwell argues that the actual source impedance of an RF
amplifier is in reality a V/I ratio, i.e. it agrees with IEEE
definition (1)(B).

If the signals are analog and not digital, you might be able to buy a
pair of 2 gig audio/video sender units made for home TV signals. Just

use one or the other of the left and right audio input jacks. Or the yellow video jack. You will need a mini pin to RCA adapter. The range on those things is usually about a 100 feet or less.
It just might work.

Cecil suggested reading Chapter 19A in Reflections to view the results of my extensive measurements of the output resistance (impedance) of RF power amps, but except for Jim and Richard, it appears that the others have not. Actually, Chapter19A is an addition to Chapter 19, which when taken completely will provide some information that will hopefully change some minds concerning the maximum power delivered. It should be understood that 'maximum' power delivered is that power delivered with a specified level of drive.

For example, if the drive level is set to deliver a maximum of 100w, and the pi-network is adjusted to deliver that maximum power into its load, the source resistance (impedance) will be the (complex) conjugate of the load impedance. We're not talking here about the very maximum power that the amp can deliver, with max drive, max plate current, etc.

If you review the 19A portion of you will see beyond a doubt that the conjugate match exists between the output of the pi-network and its complex load impedance, and that the maximum power delivered at the drive level that allows only 100w to be delivered as the maximum.

Further review of all the data presented there will also show that the output resistance of the amp is non-dissipative, while the dissipative resistance is that between the cathode and plate. The reason the efficiency of the amps can exceed 50 percent is because the cathode to-plate resistance is less than the non-dissipative output resistance,

where that R = E/I appearing at the output of the pi-network.

Walt, W2DU

I hope the review of my measured data will clear up some of the confusion concerning the output resistance (impedance) of the RF power amp.

Walt, W2DU

Cecil suggested reading Chapter 19A in Reflections to view the results of my extensive measurements of the output resistance (impedance) of RF power amps, but except for Jim and Richard, it appears that the others have not. Actually, Chapter19A is an addition to Chapter 19, which when taken completely will provide some information that will hopefully change some minds concerning the maximum power delivered. It should be understood that 'maximum' power delivered is that power delivered with a specified level of drive.

For example, if the drive level is set to deliver a maximum of 100w, and the pi-network is adjusted to deliver that maximum power into its load, the source resistance (impedance) will be the (complex) conjugate of the load impedance. We're not talking here about the very maximum power that the amp can deliver, with max drive, max plate current, etc.

If you review the 19A portion of you will see beyond a doubt that the conjugate match exists between the output of the pi-network and its complex load impedance, and that the maximum power delivered at the drive level that allows only 100w to be delivered as the maximum.

Further review of all the data presented there will also show that the output resistance of the amp is non-dissipative, while the dissipative resistance is that between the cathode and plate. The reason the efficiency of the amps can exceed 50 percent is because the cathode to-plate resistance is less than the non-dissipative output resistance,

where that R = E/I appearing at the output of the pi-network.

The earlier portion of Chapter 19, that appears in Reflections 2, can be downloaded from my web page at www.w2du.com, click on 'Read Chapters from Reflections 2', and select Chapter 19.

I hope the review of my measured data will clear up some of the confusion concerning the output resistance (impedance) of the RF power amp.

Walt, W2DU

Exactly how do you determine the s-parameters for a single-port black box? It is my understanding that an s-parameter analysis requires an input port and an output port to be able to measure the parameters. Where is the input port on an RF source?

What you seem to be measuring is the effect of one or more physical impedance discontinuities existing in an environment of interference. Is what you are measuring the actual dynamic source impedance? If I understand correctly what Walter Maxwell is saying is that whatever combinations of physical impedance discontinuities from which you guys are reflecting your test signals, it/they are *not the source impedance* which is a V/I ratio that originates in the source. A V/I ratio and a physical impedance discontinuity do not yield the same reflection coefficients for a 2-port device.

I used a 2 port VNA frequently for antenna measurements, with the
difference that a single port calibration takes less time than a full
two port calibration.

I would recommend you to measure something yourselves, or put it into
a simulation. You will see that it doesn't matter whether you use a
deltaV/deltaI setup (complex values, not magnitudes) or reflection
(time varying phase of VSWR) measurement. Just try to explore other
paths and discover other insights.

It doesn't matter when you are measuring a single port device that
contains a generator in it (as long as your VNA setup is able to
distinguish between the output generated by the single port device and
the reflection towards the VNA).

There is similarity with measuring antenna impedance (single port
measurement) when close to (broadcast) stations. Your antenna is a
generator in that case. You can't use the non-coherent type of VSWR
analyzers as the detector detects the signal from the broadcast

station also. However when using a device with a coherent (multiplying) detector you can, as the detector doesn't respond to the output because of the (broadcast) station.

With Tom's HP89410 setup, the injected signal for S11 can be well within the modulation bandwidth of SSB (that means well within 1 kHz of the transmitter's carrier frequency).

When you have good understanding of diode detectors, you can even do it without a VNA by using heterodyning and put your focus on the phase and amplitude of the beat frequency.

With kind regards,

Please take a look at the numerous measurements performed by Walter
Maxwell.

Let's take a simple example of the single-port s-parameter results.
There exists a black box with one exposed port. The impedance is
measured to be 50+j0 and s11 is assumed to be zero when driven by a 50
ohm source. There could be a 50 ohm dummy load in the box but there is
not.

Actually, inside the black box is a 1/4WL Z0=100 ohm transmission line
routed to a 200 ohm resistor. s11 is certainly not zero and is
measured, using the 2-port procedure, to be 0.3333.

Which s11 is correct, 0.0000 or 0.3333?

Hello Cecil,

Assuming that your black box is a 100 Ohms quarter-wave line with 200 Ohms termination (all inside the black box), S11 (50 Ohms based) = 0, as the input impedance of your black box is 50 ohms. If you like, you may see your room temperature black box as a source with about −174dBm/Hz output and an output impedance of 50 Ohms.

Wim

This is what happens when one changes math models in mid-stream. s11
is NOT zero at the mouth of a stub. The impedance looking into a stub
is IEEE definition (1)(B) and cannot have an s11 of zero unless the Z0
of the stub is infinite, which it is not.

Thanks for proving my point. The single-port s11 is completely
different from the dual-port s11 and that is most likely what is
happening with your attempts to measure the source impedance of an RF
amplifier. How can you possibly promote an experimental approach where
s11 changes by an infinite percentage depending on whether one
measures it as a single-port parameter vs a dual-port parameter???

From your text I didn't conlude it is a stub (but just a series line
section that transforms 50 OHms into 200 Ohms).

Please explain (or someone else), as I don't understand anything of
the above with regards to a PA. You described a single-port device and
now starts talking about a two-port device.

If you want to prove that for a two port device the impedance
corresponding to S11 may not be equal to the input or output impedance
of port 1, you are right. When S12*S21 isn't zero, the input
impedance depends on the termination of port 2. This is just S-
parameter math, nothing magic.

For the PA case, the active device is the termination for the two-port
matching network, so in that case S11 measurement equals the input/
output impedance of the PA (just a single port measurement). See it as
the output impedance of the active device is connected to port 2 (of
the matching network), and the VNA (or load) is connected to port 1
(that is the output side of the matching network).

The PA reduces to just a single-port network with a source in it
(compare it with the antenna example where a transmitter is in the
vicinity). As long as the injected signal (or slight mismatch
connected to transmission line with increasing length) is small, you
can apply the small signal approach.

As suggested earlier, you may dive into active load pulling:
http://www.focus-microwaves.com/template.php?unique=232

It doesn't matter whether you show some mismatch to a PA, or a perfect matched load with a small source in it representing the signal that is reflected towards the amplifier.

When a source is tuned (e.g. through a pi network or any other matching network between a PA and its load) such that maximum power is delivered to the load, it's axiomatic that the source impedance is the complex conjugate of the load. Is there really a need for a whole chapter for that?

You say, "We're not talking here about the very maximum power that the amp can deliver, with max drive, max plate current, etc." I beg to differ. That is EXACTLY what we are talking about. We're talking about modern amplifiers that would be destroyed if not for protection circuits, if they were loaded with a load that resulted in maximum dissipation in the load. We're talking about even old amplifiers with enough grid drive that they COULD be loaded to higher power output, but for reasons of wanting the active devices to survive for a reasonable length of time (or possibly other reasons), are not loaded so heavily. If you want to exclude such amplifiers from consideration, then I would hope none would disagree about the relationship of the load impedance and the source impedance. You needn't have made any measurements to convince me of that.

Cheers,
Tom

If you recognize the example as a two-port device, you correctly
measure an s11 of 0.3333, (100-50)/(100+50). If you happen to overlook
the second port to which the 200 ohm resistor is attached and treat
the example as a single-port device, you measure an s11 of 0.0000,
(50-50)/(50+50). The example has not changed between those two
measurements so which s11 is correct? Doesn't that fact give you pause
to wonder if you are making essentially the same mistake with the PA
measurements?

You want to know the output/input impedance of your black box, this means you should look into the 100 Ohms line with 200 Ohms termination. We will see 50 Ohms, no matter the reference impedance of the VNA. If it was a 75 Ohms VNA, it would read S11 = -0.2. What the 200 Ohms resistor sees is not important if you just want to know the behavior of the single-port black box.

> Doesn't that fact give you pause to wonder if you are making essentially the same mistake with the PA
> measurements?

I am very sorry Cecil, but I still don't see the point where the discussed method may go wrong.

The only thing I could think of is that you have in mind a setup where the input of the PA is port number 1 (and the output is port number 2) and you carry out a full-port measurement. For a full class-A, AB, non-saturated PA, this may give useful results. When S12*S21 << 1, S22 will equal the output impedance, otherwise you have to do the match.

In real world many amplifiers do not behave as a linear system (food for discussion) and then the two-port setup will fail, as during S22 measurement the input port is terminated with 50 Ohms (so there is no source that provides output).

Therefore carrying out a single-port measurement with a slightly off-carrier frequency (to create non-coherence) under required output conditions, will result in a meaningful output impedance. As mentioned before, doing a (slow) manual load pull measurement may give

different results because of bias and supply voltage variations.

Everyone seems to be charging ahead, willy-nilly, without seeing the
point which is that there are other effects present besides
reflections.

> Therefore carrying out a single-port measurement with a slightly off-
> carrier frequency (to create non-coherence) under required output
> conditions, will result in a meaningful output impedance.

Nope, it won't because virtual impedances don't cause reflections.
Only physical impedance discontinuities cause reflections. The rest of
the redistribution of RF energy is caused by the superposed
interaction between forward and reflected waves, i.e. interference
effects. Most hams do not understand the role of interference in the
redistribution of RF energy. Hope this helps.

http://micro.magnet.fsu.edu/primer/java/scienceopticsu/interference/waveinteractions/index
.html

Please pay close attention to the last paragraph. "... when two waves
of equal amplitude and wavelength that are 180-degrees ... out of
phase with each other meet, they are not actually annihilated, ... All
of the photon energy present in these waves must somehow be recovered
or redistributed in a new direction, according to the law of energy
conservation ... Instead, upon meeting, the photons are redistributed
to regions that permit constructive interference, so the effect should
be considered as a redistribution of light waves and photon energy
rather than the spontaneous construction or destruction of light."

You guys are presuming that reflections are the only thing you are
seeing and that is just not true. You are also seeing interference
effects without realizing it so your conclusions are doomed to failure
unless you can differentiate between constructive/destructive
interference and reflected waves. Since there has been no mention of
interference effects, I am forced to conclude that you guys are
ignorant of such effects.

The signal injection is just a way of emulating a non 50 Ohm
termination where you need to change load and or cable length. By
using slightly off-carrier frequency, you emulate a changing phase of
reflection coefficient. That emulated reflected signal goes to the PA
and interferes with the forward signal (produced by the PA). That
interference is required as this modifies current and voltage at the
PA's active device.

To be honest, I, and my ham friends, never had to use photon theory to
solve problems in both amateur and professional RF-Engineering. So I
think this doesn’t contribute to the discussion.

> You guys are presuming that reflections are the only thing you are

> interference effects, I am forced to conclude that you guys are
> ignorant of such effects.

Worth to try yourself:

1. Set up a simple linear circuit in simulation (for example AC voltage source some impedance in series). You can use whatever (free) program you like. Use a program that allows transient (non-linear) simulation as you are working with two frequencies at the same time. I used Beige Bag spice A/D professional version 4 (not free)

2. Determine the output impedance via load pulling (for various loads if you like)

3. Do the same with the "VNA" setup (with the PA producing RF output). You need to observe the envelope variations or you have to insert a narrow band filter to suppress the carrier. I prefer observing the sinusoidally changing envelope (as this shows distortion immediately (intermod products) and saves me the settling time for the filters).

In simulation you have ideal current meters, so if you use voltage and current directly (and drop the directional couplers) you can skip the conversion from reflection coefficient to impedance.

Here you will see that the output impedance is independent of VSWR (as we started with a linear circuit) and both methods give same results.

If you like, you could now implement a real PA in simulation and do the simulation again. Note that tuning the amplifier in simulation is (very) time consuming. You will notice that, depending on the amplifier you implemented, impedance will change with increasing VSWR presented to the amplifier (valid for both methods).

I did all the above with various circuits to prove the fitness of the method. For some circuits there was a difference in result. After evaluation, that difference was caused by changes in (bias) supply during "manual" load pulling (that initially did not happen during the slightly off-carrier signal injection). With stiff bias conditions, the difference disappeared to within the accuracy limits.

Knowing that EM RF waves must necessarily obey the laws of photon
physics can save one from all sorts of technical blunders. But feel
free to blunder on.

Hello Cecil,

Maybe you should change your attitude from "it is wrong" to "it may be true". This might open your mind to study other insights.

When measuring an RF current in a PA, everybody ignores the quantisation of charge. Is this lack of knowledge?

The frequency of our waves is sufficiently low to ignore any quantisation effects due to photons. Is this lack of knowledge? In my opinion a good Engineer knows what he can ignore and what not to efficiently solve a certain task.

Starting a discussion about photons, in my opinion, is a way to reduce the S/N ratio of the discussion.

With kind regards,

Wim

I think most of the discussion is ignoring lots of things... first of all you must answer the question; Does it really matter? If it does, then i will assume that you are a designer and know how to apply the tube characteristics to come up with a design that matches your selected tube to the expected load... but does that process really ever describe the 'output impedance'?? Then you must also consider the tuning parameters employed... sure, you can measure the output impedance at a given operating point, but answer the question again; Does it really matter? Or do you need to measure it over a wide range of operating conditions? Every operator i have seen tune up one of my amps has done it a little bit different... heck, i don't even do it exactly the same twice in a row i bet. So when i am running an amp into a switchable set of 7 different antenna combinations on a given band, can tune from one end of the band to the other without touching the settings, and can make an infinite number of small adjustments to the drive, tune, and load settings, and on some bands can tweak a tuner after the amp to 'make it happier', do I really care what the 'output impedance' really is? As long as the matching network provides adequate adjustment so i can get out the desired power into my various loads while keeping the tubes within their operating limits, do i really care what the 'output impedance' really is at any one set of conditions that i may never exactly duplicate again? I think not. So this boils down to an academic discussion, and as in many cases where no one has, or can, make an exact statement of the problem the specific answer remains elusive. So consider this, until you have a complete statement of the problem you will never be able to derive a value that any two of you will agree on, let alone actually try to set up a measurement of.

Hi, Wim -

I believe his confusion is the one-port vs two-port problem. I don't have a problem with your explanation. But, I think he is throwing in a port where he should not.

Cheers,
John

The second port is actually there on the other side of the black box,
but it has been overlooked. Doesn't it give anyone pause to realize
that the s11 parameter changes by an infinite percentage depending
upon whether it is measured as a one-port system or as a two-port
system? If that can happen with a passive black box, consider how much
more complicated it might be with an RF source included in the black
box.

No, the antenna still has the same characteristics. You changed the
impedance at a point remote from the antenna.

> While this is hardly news, it got me wondering whether a 75-ohm cable
> will load the transmitter the same. Doesn't seem like it.

It depends on a number of factors. For example, use a .5 wavelength 75
ohm cable to feed a 50 ohm resistance. Your transmitter happily thinks
it is 50 ohms. Because it is.

> My point: Using 75-ohm cable to improve the match at the antenna

>
> "Sal"
> (KD6VKW)

Transmitters don't have a clearly defined output impedance and, whatever
output impedance is there, doesn't necessarily mean anything.

Your main concern is to provide a 50 ohm load for the transmitter to see.

Actually, it the feed line and load are both 75 ohms, you will only see
a 1.5:1 SWR. Don't worry about it.

Cheers,
John

Hello Dave and John,

When you look to my first posting to this thread, you may conclude that I agree with you.

We had such a discussion about a year ago where I stated that most RF amplifiers do not have 50 Ohms output impedance. That statement was heavily disputed by some persons. I tried to support that statement with simulations, but without any success.

Regarding the "academic discussion" I also agree. In my professional career where I designed several RF PA's, only 2 times the output impedance of the amplifier was of importance. In one of these cases I couldn't meet the specs and had to insert attenuation (some waste of power…).

The thing I don't like is that some people criticize methods used by some of the group members without a solid foundation.

Regarding the two-port single-port issue. One can setup a reasoning based on a two-port setup, but that significantly complicates the matter without giving any additional insight. I tried to keep it simple by referencing to a VSWR measurement (with an antenna analyzer) of an antenna when a strong transmitter is nearby, but it seems I wasn't clear enough for all people following this thread.

With kind regards,

Wim

What a strange ellipsis.

In other words if this statement bears upon the discussion, then it
deserves a fuller context. Why was it of importance?

"Everything should be made as simple as possible, but not simpler."
Albert Einstein

Here's my earlier example:

Source-----Z0=50----x----1/4WL Z0=100----200 ohm load

s11 is measured at point x equal to 0.3333 and also 0.3333 at the
load. Nowhere is s11 equal to 0.0000. Put everything to the right of
point x into a black box and s11 measures to be 0.0000 under exactly
the same conditions??? And you guys want all of us to trust that
measurement enough to predict the disputed source impedance of an RF
amp when it cannot even predict the load impedance in the above very
simple passive circuit?

There are reflected waves at point x (s11*a1) that are equal in
magnitude and 180 degrees out of phase with the reflected waves
transmitted back from the load (s12*a2). The two waves undergo
destructive interference at point x which creates a V/I ratio of 50 at
point x. But the absence of *net* reflected energy at point x does not
mean that there are no reflections at point x. There are actually two
sets of reflections at point x that mask any attempt to determine the
actual value of the load impedance by measuring s11 when the system is
installed inside a black box. It is foolish to presume that there are
no similar interference patterns inside an RF amp. In fact, the only
condition where there is no interference inside a simple voltage
source is when there are no reflections or the reflections are
orthogonal to the source signal.

There is a good discussion of the role of interference in the creation
of virtual impedances in section 4.3 of "Reflections", by Walter
Maxwell. Even though a lot RF engineers scoff at the laws of EM wave
physics from the field of optics, the best explanation of interference
I have ever read is the chapter by the same name in "Optics", by
Hecht. Another good chapter in "Optics" is "The Superposition of
Waves".

Hello Cecil,

Basically, it doesn't matter what is inside the box. It can be fully characterized by its impedance versus frequency (small signal approach).

I am fully aware of that there are (back and forth) reflections in the quarter wave line inside the black box. However in case of a black box, you don't know that (black box principle).

Same thing happens in most narrow band antennas. The antenna wire itself may be subjected to (for example) VSWR = 10, though the impedance can be 50 Ohm (and therefore doesn’t introduce reflection in a 50 Ohms feed line). I know that this 50 Ohms is the result of interfering waves/signals, but an MFJ 259B antenna analyzer, or my FT7B doesn't (and doesn't need to know it).

One could only guess what is a black box based on its impedance versus frequency curve, S11 curve or Time domain response (I had to do this in school).

So if we decide to open the black box and we put the reference plane inside the box, we get a new thread, something like: "why has a PA certain output impedance?", or "what is the large signal output impedance of valves, BJT, FET, etc?".

With kind regards,

Wim

actually, to provide an *acceptable* load for the transmitter that
maximizes radiated RF power. That might not be 50 ohms.. and I don't
know that we actually care what it is, unless we're designing amplifiers.

50 ohms is basically a "standard test condition" so that you can compare
amplifiers, and it happens to be convenient that everything is made with
the same standard impedance. That way, your test load (which will
dissipate a fair amount of power in some tests) can be located somewhere
different, and connected by a length of transmission line with the same
impedance, so the test at the amplifier output reference plane is still
valid.

If what is inside the box doesn't matter, why waste time trying to measure what is inside the RF amp box? What can be "fully characterized" is the box's relationship to everything outside of the box. Exactly what is inside the box cannot be ascertained at all while we handicap ourselves with a blinders. When we actually look inside an RF amp, we find active non-linear devices upon which we all have been warned about trying to use linear assumptions.

It doesn't matter what is inside the box when *conditions outside of the box* are being considered. EE201. What is inside the box matters considerably for *conditions inside the box*. For instance, replacing a 50 ohm dipole with a 50 ohm lumped circuit doesn't change things between the load and the source. But it causes an almost infinite change from the load out to the rest of reality.

Anything else I could say on this subject would be repetition.

During 1991 Warren Bruene used the RPG method in which he believes he measured the source resistance of an RF power amp, which he calls 'Rs'. I have never agreed that his method measures the source impedance, or that his data has any relevance to anything.

Consequently, I am not impressed with the discussion going on here concerning applying a signal back into an operating RF power amp to determine the source impedance. Please define 'source impedance'--where is it located in the amp? At the plate? At the output of the pi-network?. And how do you know the data obtained using this method is correct? Have you verified it by comparing it with data obtained using another method?

I made a statement in an earlier post that when measuring the output impedance using the 'load pull' method we're not concerned with the absolute maximum power that can be delivered, but instead, limiting the 'maximum' power delivered to that which can be delivered with a specific level of grid drive, one which allows the power to be limited to that of a normal operating level. Tom disagrees with this position, that it is really the ABSOLUTE MAXIMUM power delivery that should be considered. As you can see, I don't agree with Tom.

I don't know how many on this thread have actually reviewed the portion of my Chapter 19 that presents the step-by-step procedure I used in determining the output impedance of the Kenwood TS-830S tx, which shows precisely the output impedance appearing at the output of the pi-network.

To summarize the procedure that I maintain will provide an accurate measurement of the output impedance appearing at the output terminals of the pi-network is as follows:

1) Adjust the loading and tuning controls of the amp to deliver all the available power to a complex load in the amount normally used in operation with the setting of the grid-drive level required to obtain that output power.

2).Measure the impedance of the complex load.

3) The output impedance, or 'source' impedance of the amp appearing at the output terminals of the pi-network is the complex conjugate of the load impedance.

Now, when you measure the source impedance using the externally-injected signal, does the data from that measurement agree with that of the load-measuring method? If it does, then I'll agree that the RPG method is valid. If it doesn't I'll continue to have considerable doubt as to its validity. But I'd still like to know where the resistance measured by this method is located in the amp.

Walt

It seems to me that we maybe should not be talking about source impedance but maybe about 'regulation' or some other equivalent word.

For an open-loop source made from real components, I think one will always find that there is a dE/dI number for output loading that we can call source resistance.

It does not always mean that there is a physical resistance in the circuit. It is simply a measure of the ability of the device to provide an unvarying voltage under conditions of varying load.

Does this make any sense?

John

Hello Walt,

Except for bias or supply voltage change due to load change, load pulling does give similar results as off-carrier signal injection. I did this in simulation for various circuits (linear and non-linear). You may remember that I put something in a document (discussion of last year, it is still on my website).

You can get different results in case of soft power supply or bias supplies. In case of manual load pulling, bias/supply voltage may change (think of change in grid current due to change in RF plate voltage). There is sufficient time for all voltages and currents to settle. I added a section on the envelope response due to bias current/voltage change.

When you use the injection method (for example with 130 Hz offset), it is like load pulling where you switch the load 200 times/s (more specifically you rotate the phase of the reflection coefficient as seen by the PA). In such a situation bias and supply voltages will settle to an average value resulting in (slightly) different results.

While not relevant for here, but nice to mention, stiffness of bias supplies has influence on IMD also.

With kind regards,

Wim

Hello John,

You are correct with respect to the physical resistor. If you tune a real class-C amplifier for maximum output power (conjugated match), you may not reach the highest efficiency, but at least significantly above 60%. So this shows that there is no "physical" 50 Ohms in the PA (assuming 50 Ohms load). If so, the efficiency would never exceed 50%.

When you change the load (after tuning for maximum output) from 50 Ohms to (for example) 30 Ohms and would carry out an impedance measurement around that 30 Ohms load resistance, you will measure something completely different. With "around 30 Ohms" I mean using 32 and 28 Ohms (for example).

With kind regards,

Wim

Acceptable is what the manufacturer recommends for his gear. What does
this have to do with the device's output impedance?

John

This is comparable to the concept of "dynamic resistance" and, as well,
to "negative resistance" (as exhibited by gas discharges for instance).

The local slope of the V/I curve is negative, but that doesn't mean that
it has negative power.

> this have to do with the device's output impedance?
>

Absolutely nothing.. which is the point. Manufacturers have to make
their device work into some sort of loads, but can't test every possible
load, nor necessarily optimize the design for every possible load that
someone might use.

So we use, as a convention, that we'll measure the output power or DC to
RF conversion efficiency or Power Added Efficiency or whatever, with a
50 ohm resistive load hooked up to it.

That doesn't mean that we actually want to use a 50 ohm load in real
life. Maybe I have an amplifier designed to drive a loop antenna with a
resistive 10 ohm impedance. I might optimize it for that, but, because
people want to see a spec sheet, I'm going to have to measure the output
into 50 ohms and put that on the data sheet.

Or, perhaps, the active devices I use happen to have a "natural" output
impedance of, say, 8-10 ohms, so I put a 4:1 transformer on the output.
My box, if I were to measure the output Z, would show about 40 ohms.
I'd test it with a 50 ohm load, make sure I could put out 100W into that
load so I can sell it as a "100 W transmitter" and be done with it.

It might happen that you could hook up a 40 ohm load, or a 20 ohm load,
and it will work just fine, and may even put out more than 100W.

The fact of the matter is that ham manufacturers don't actually specify
the output Z: they just give you a range of outputs into which they'll
guarantee the transmitter won't fail. (e.g. say, 25 to 100 ohms..

perhaps specified a bit sloppily as VSWR 2:1 if driven from a 50 ohm source)

Interestingly, my IC7000 manual doesn't even give a output impedance, or even a range of legal load impedances (page 150 of the manual).

Page 11 does say "Antenna Connector: Accepts a 50 ohm antenna with a PL-259 connector"

And Page 15 does say "Use a well matched 50ohm antenna" and "An SWR of 1.5:1 or lower is recommended" doesn't say it won't work, doesn't even say it only develops rated output power (on page 150) into that particular load. There is a boxed note that says that if the SWR is higher than approx 2.0:1, the transceiver's output power is reduced.

And, let's look at the service manual.. Spec page is identical to the one in the user manual. The procedure calls out a whole bunch of adjustments to set the "% power" to appropriate levels using a 50 ohm load, but doesn't say what the power into some other load Z would be.

There is a test that when you hook up 100 ohms, the internal SWR meter reads 2:1, and 50 ohms reads 1:1. But that's not a test of the transmitter's output Z, more a calibration of the transmitter as RF ohmmeter for an external component.

The ALC system actually measures the output VOLTAGE (not power) and matches that up against the setpoint for the power (implying that if you hook up a 40 ohm load, and you set the radio for 50W, you'll get a bit more out).

the Automatic Power Limiting is a current sensor: if it exceeds 22A, it reduces the drive. In fact, it kind of looks like the reflected HF power (from the sampler at the filter output) isn't used to control the drive at all.. it's just used to drive the SWR indicator. Kind of tough to tell, the prose description is a bit unclear, and I haven't followed all the signals through on the schematic.

but the summary is,

Interesting. For a community that is so tight-fisted with cash, and
so brag-hearty with power claims, absolutely no one has ever tossed
their hat into the ring that with lower than 50Ohm termination on
their rig (and I'm not talking about 45Ohms) or with a more than 50Ohm
termination on their rig (and this is certainly achievable with a
72Ohm Dipole and 70 Ohm coax) that they have then proclaimed they
substantially exceeded 100W radiated (or lost to heat for that matter)
by the same degree of offset from 50.

>Or, perhaps, the active devices I use happen to have a "natural" output

That must date to the 1950s vintage of solid state. Your own IC7000
certainly doesn't suffer that abysmal "natural" output impedance. The
RD70HHF1 for 97W into 50Ohms exhibits 0.77-j0.22 Ohms @ 30MHz, a far
cry from your supposition. Off by 1000%?

>It might happen that you could hook up a 40 ohm load, or a 20 ohm load,

Which is curious when the manufacturer of the RD70HHF1 power
transistors gives them a "No destroy" rating into a mismatch of 20:1.
Such is the inertia of 1950s design-think with modern components.

Hello Dave and John,

<snip>

Regarding the "academic discussion" I also agree. In my professional career where I designed several RF PA's, only 2 times the output impedance of the amplifier was of importance. In one of these cases I couldn't meet the specs and had to insert attenuation (some waste of powerï¿½).

Exactly..

In fact, as interesting as it would be to measure the output impedance of my radio, I started to think about what it would buy me, and came to the conclusion, almost nothing (other than satisfying curiosity).

It *might* be interesting to look at (and write an article for QST/QEX or something) "optimizing radiated power". Answering the question: do you really want a 50 ohm match on your antenna analyzer, or do you want maximum net power at the antenna feedpoint, and what that might mean for typical 100W solid state rigs, antennas, etc.

(as a practical matter, this is what automatic antenna tuners actually adjust for: either minimum reflected power, or maximum fwd-ref)

but it's possible that deliberately running a mismatch (as shown on your rig's SWR meter) might actually result in more radiated power. e.g. if at 1:1 you have 100W fwd and 0 rev, but at 2:1 you have 150W fwd and 15W reflected, so you're actually net 135W vs 100W; assuming your rig doesn't otherwise have any problems.

Maybe that's because of tradition.. it's not only hams who do that. In the professional world, there's a strong tendency to make the "interfaces" between subsystems 50 ohms, even if overall system efficiency might be improved by, say, a 25 ohm impedance. I've worked on systems where a DAC produced a balanced signal with a 200 ohm Z, and the vector modulator at the other end had a balanced input with a 200 ohm Z, but everyone insisted we put a 4:1 transformer on each end, so we could run 50 ohm coax for a <10cm run.

If you're a amp maker, you're probably going to sell a lot more amps if you specify and design for 50 ohms (the 10 ohm PA for loop antennas would be a niche market). Likewise, if you're an antenna builder, designing a product for 50 ohms will sell more than, say, 35 ohms.

In the cellphone world, because the PA and antenna tend to be developed as an integrated assembly, they're probably a bit more flexible on this.

There's also the issue of wanting to put a power meter in line (but I think that if you're using a 10 ohm system, you're probably capable of figuring out how to measure power to make sure that you're not busting the FCC limits)

Just an example. I know that modern parts are MUCH lower. The point is that if one knew you had a 3 ohm load, you could design an amplifier that would directly drive it without a transformer or network, and potentially get better overall efficiency.

Yes, but the design limit might not be the transistor mismatch. It might be a thermal dissipation limit, or some other component that's the limiting factor.

(Or even, a desire to not have to answer 1000 customer service inquiries to explain why it really doesn't matter what you hook up, or to explain, that, yes, you DO need to actually connect an antenna of some sort)

Amateur radio, particularly in the mass market, is pretty slow to move.

Strangely enough, for any fixed configuration with reflections, one
way to maximize radiated power is to maximize reflected power at the
antenna feedpoint.:)

Well, that and the rest doesn't respond to the observation that NO ONE
makes a claim of more power from a rig that DOES NOT have a source
resistance of 50 Ohm.

>in the professional world, there's a strong tendency to make the
>"interfaces" between subsystems 50 ohms, even if overall system
>efficiency might be improved by, say, a 25 ohm impedance.

Retail engineering is ruled by a market economy. You have offered a
reductio-ad-absurdum of the native components offering ~10 Ohms
without the cost of intervening transformers. Such an "improved
efficiency" at lower cost option has been available for decades and
has yet to appear as a retail product for the tight-fisted Ham market.
Market logic shows by the force of economy that such a solution is not
viable.

>>a far cry from your supposition. Off by 1000%?
>
>Just an example.

An incredibly poor one in the context of 100W transmitters when garden
variety examples abound.

>I know that modern parts are MUCH lower.

That deliver 97W into 50 Ohms at 30 MHZ with a nominal 12VDC supply? I
smell another poor example.

>>> It might happen that you could hook up a 40 ohm load, or a 20 ohm load,

"Does" with how much more power? When I observe the contents of the
page at that link = NOT ONE WATT MORE!

In fact, if we follow the logic of lowered Rs yielding more power, his
own data flips this! He reports the same 100W available at higher Rs.

However, all that aside, when you observe your comment above, the link
"Does not" offer any support to it. In fact on9cvd explicitly offers:
"This is an ambiguous message"

>> Which is curious when the manufacturer of the RD70HHF1 power

Consult the original spec. It is quite specific. The characteristic
of
Load VSWR tolerance: Load VSWR=20:1(All Phase): No destroy
is not a dissipation reference.

I need an NMO mount for a rather long antenna that would put a lot of strain on the sheet metal of the roof of my van. Underneath the sheet metal I can use a fender washer. On top I need a mount with a larger base area and the NMO mount on top of that. It might look like a smallish mag mount but without the cable showing because that would come from inside through the hole. If anyone knows of a manufacturer that makes such a mount please pass the name along. I've tried several searches but without being able to guess what order the words would be in I get nowhere. Any tips would be appreciated.

Hello,

Regarding the defined output impedance.

The first time was during my thesis (third harmonic peaking PA). The stability margin was not very large (expected), and it could be improved by keeping the impedance seen from the base within certain limits. My teacher said, be careful, you only have two devices (BLW76). I tried to make an exciter (based on 2SC1307 BJT) with defined output impedance, but without success. So in the end I

increased the output power of the exciter and inserted a 3 dB attenuator, not elegant, but it did the job.

The second time was for H-field generation where wider bandwidth was achieved by adding a second resonator. When driving from a 50 Ohms source, it had a nice Chebyshev type pass band. Because of the ripple, it shows reflection in the pass band (this happens with Chebyshev response). However when driving from a PA (that was flat within the pass band when loaded with 50 Ohms), everything went wrong.

I redesigned the filter/coil combination, designed a switching PA (half bridge in class DE operation) and skipped the 50 Ohms (I designed around 8 Ohms). The PA drives the filter directly in such away that most of the time the PA sees a nice (mismatched) load (that is inductive for harmonics). This resulted in the desired pass band with significantly increased efficiency. The strength of the H-field is controlled by varying the supply voltage (PWM circuit).

Leaving out the 50 Ohms in between, saved several capacitors and inductors.

With kind regards,

Wim

What about using epoxy (or brazing) to mount a NMO on a larger piece of
metal.

Hello Jim,

I agree with the PA load mismatch issue. It is possible to get (some)
more net power by applying mismatch to a PA stage (from experience).
But frequently it comes with too much increase in input power (so very
hot heatsink).

In case of high efficiency designs, the active devices may communicate
to you by means of smoke or ejection of (hot) particles.

Wim

Hi Wimpie and KD5YI,

Will you please explain how it is possible to get more power delivered by applying a mismatch to the output of a PA?

And for KD5YI specifically, I believe you have presented some inaccurate math calculations. You begin with delivering 100w into a matched load. Then you say you mismatch to 2:1 and get 135w forward and 15w reflected, leaving 120w delivered. You must be kidding!!

First, with a 2:1 mismatch and 100w delivered by the PA, the reflected power is 11.111w, which when added to 100w from the source, the forward power is 111.11 watts. When the reflected power that returns to the load is subtracted from the forward power, the result is 100w. You've heard the expression 'there is no free lunch'?

So please explain to me, if you can, how you can deliver 120w when the source is 100w.

Walt

Ooops, my error, you said you're getting 130w delivered, not 120w as I
said incorrectly.

No he is not kidding. I observed the same. At that time I was lucky to have full access to HP, Advantest and Rohde & Schwarz equipment to double-check everything (I first blamed my own gear). You should leave the idea that all PA's have 50 Ohms output impedance, then it is easy to explain yourself.

A certain load that has mismatch referenced to 50 Ohms may have a nice match to a system with non-50 Ohms output impedance.

The extreme cases where you can get significantly more net output power by applying mismatch, are PA's with high efficiency (class-E, -D, -DE, etc). I am currently designing a balanced class-E 500W stage. It can deliver 1 kW, but within very short time the mosfet's will explode (if the supervisory circuit doesn't act).

Wim, are you saying that by using Class E amps you are able to violate the Laws of Physics pertaining to the Conjugate Matching Theorem and the Maximum Power Delivery Theorem? I cannot agree.

A load doesn't care what the source is. If the load impedance is the complex conjugate of the source, all available power will be delivered to the load. Then, if the load impedance is either increased or decreased, the power delivered will decrease. Are you now saying that the concept I just stated above is no longer true? If you are, please explain in detail why this is so. How does 'high efficiency' overcome the requirement for impedance matching in the delivery of power?

And are you agreeing with an earlier poster that with a 100w source and a mismatch of 2:1 the forward power will be 135w and 15w reflected, the power delivered to the load will be 130w? If so, will you please explain in detail how this can occur?

Walt

Walt, Maybe you should familiarize yourself with class E (and other high efficient topologies). Set up a simulation (or measurement) and try to apply your "conjugated match" thing. You will find out that you can't make a class E PA that operates under conjugated match, unless you are going to play with the power supply's internal resistance (so the system becomes power supply limited). My current design outputs 500W into 4.5 Ohms, however the output impedance (load pulling) is < 1 Ohm.

The reason for non-conjugated matched operation is that in class-E the device is in voltage saturation for about 50% of the time. During that time the device has no gain, so a device used in class-E has less gain then the same device used in a non-saturated application. In other words: tuning is designed for highest efficiency, not highest output power.

Quote from text above: "If the load impedance is the complex conjugate of the source.....". This If-statement has a "false" result for many PAs, try to broaden your view.

> Then, if the load impedance is either increased or

Yes I agree with him, see my reaction to that statement

My class-E PA design that I am doing now is designed for a 4.5 Ohms nominal load. If I change that load to 2.5 Ohms (VSWR=1.8), output increases to > 700W, but it will be destroyed due too non-favourite combination of Vds and Id.

> Walt

With kind regards,

As I understand it, Walt's approach is to pick a point inside the
source at which the output becomes linear through filtering and call
the impedance at that point the linear "source impedance" (including
some boundary conditions). It is akin to the motion of a pendulum in a
clock being linear even though the sustaining energy comes in non-
linear pulses.

Well, Wim, I still don't see how a 2:1 mismatch can achieve 135w forward and 15w reflected with a 100w source. How can a 2:1 mismatch achieve 130w forward power, when that mismatch can only reflect 0.111 x 100w? Also, how can that mismatch achieve 15w of reflected power when that mismatch can only reflect 0.111 x 100w? And how can 11.111 watts of forward power add to 100w to achieve 130w? I don't see how the power reflected at a mismatched load can be affected by the nature of the source.

But I do understand how with a 4.5-ohm load can deliver 500w and a 2.5-ohm load can deliver 700w. I now understand what you mean by a mismatch can increase the power delivery. (Actually, a change in mismatch)

But Wim, you pulled a fast one one us!!! Until now you didn't tell us that the source resistance of the source was 1 ohm!!!

You also didn't tell us what the power would be if the load was 1 ohm (thus matching the load to the source) if the power supply was sufficiently large so the power delivery would not be limited by the power supply. So in reality, you really DON'T get an increase in power delivery by mismatching, but actually a decrease. What you're really doing is obtaining an increase in power delivery by decreasing the amount of mismatch from 4.5:1 to 2.5:1.

So now I understand that you haven't violated any laws of physics, but IMHO, you have been misleading when you say you obtain a increase in power by mismatching, because that statement isn't really true, is it?

take care,

Walt

Hello Walt,

Off course I agree with you that you can never have more power then
the conjugated matched power, but many PAs don't operate in this

regime (as my very extreme class-E case). It was the reason for mentioning:

"A certain load that has mismatch referenced to 50 Ohms may have a nice
match to a system with non-50 Ohms output impedance."

The problem is in whether you define mismatch based on the ohmic value printed on the back of the PA, or on the actual output impedance of the PA (that you mostly don't know in case of many solid state PA's).

As the actual output impedance of the PA may not be 50 Ohms (for example 100 Ohms), a 50 Ohms load (as mentioned on the back of the PA) will provide the stated power (for example 100W). By applying 100 Ohms (that is VSWR = 2 for a 50 Ohms reference), the net power will increase to 112 W. Actually it wasn't me to experience this mismatch isue first, but my father during the time that CB was very popular overhere.

The above example assumes that the output impedance of the PA is independent of load. Of course this is only true when the actual voltage across the active device and current through it doesn't saturate the active device too much.

I think the saturation issue is one of the advantages of a linear PA with accessible R an X tuning. You just tune for maximum output given a certain load and drive (you may use plate current as a guide also). As long as your SSB signal's PEP stays below that output power, your active device will not go into voltage saturation and IMD will likely be acceptable.

In case of a wide band push-pull PA, VSWR = 2 (with inconvenient phase) may provide a load where the active devices (mosfet or BJT), will go into voltage saturation at a net output power below the rated power of the PA. For constant envelope modulation this isn't problem, but for SSB/AM it isn't good.

With kind regards,

Wim

Hi Walt,

Irrespective of who the author is of this statement (I've lost track),
I too would like to see how this is reconciled.

But seeing that you've asked several times....

Thanks for the reply, Wim, but you seem to be evading my questions and concerns by what appears to be going off on tangents unrelated to my questions.

Perhaps I need to refresh Electronics 101, because I simply can't understand the example you provided.

You have a 100-ohm source terminated with a 50-ohm load that provides 100w. But you say with the VSWR = 2 the net power will increase to 112w. How does this happen?

Wim, you are making statements that seem to disagree with known principles, yet you give no explanation of how these statements can be justified in relation to the known principles.

And please tell me, Wim, what RF amps do you know of that have the source impedance indicated on the back? And you refer to solid-state amps, when you know my discussion (and experience) is with tube amps with pi-network outputs. I am totally ignorant on the operation of solid-state amps.

I would like to be learning something from my discussions with you, but I'm sorry, Wim, you're making me feel more stupid the more we continue.

Walt

Walt, here is probably what Wim means by that.

Source------1/2WL 50 ohm lossless------RLoad

Vsource = 212v, Rsource=100 ohms

If Rload = 50 ohms, PLoad = 100w

If Rload = 100 ohms, PLoad=112.5w

Wim must be assuming a 50 ohm SWR in both cases.

Dear Wimpie: Many thanks. I am always on the look-out for applied electronic problems for a colleague who is particularly skilled at crafting practice problems for the professional engineering exam (chartered engineer in Europe).

Your comments about filter response reminds me of the (analog) FM receivers that had wonderful suppression of the next channel over, but horrible performance in the presence of noise from ignition - while other receivers had great performance in both respects. As you know, it had to do with phase response. Chebyshev is not always desirable.

Warm regards, Mac N8TT

Hello,

Regarding the defined output impedance.

The first time was during my thesis (third harmonic peaking PA). The stability margin was not very large (expected), and it could be improved by keeping the impedance seen from the base within certain limits. My teacher said, be careful, you only have two devices (BLW76). I tried to make an exciter (based on 2SC1307 BJT) with defined output impedance, but without success. So in the end I increased the output power of the exciter and inserted a 3 dB attenuator, not elegant, but it did the job.

The second time was for H-field generation where wider bandwidth was achieved by adding a second resonator. When driving from a 50 Ohms source, it had a nice Chebyshev type pass band. Because of the ripple, it shows reflection in the pass band (this happens with Chebyshev response). However when driving from a PA (that was flat within the pass band when loaded with 50 Ohms), everything went wrong.

I redesigned the filter/coil combination, designed a switching PA (half bridge in class DE operation) and skipped the 50 Ohms (I designed around 8 Ohms). The PA drives the filter directly in such away that most of the time the PA sees a nice (mismatched) load (that is inductive for harmonics). This resulted in the desired pass band with significantly increased efficiency. The strength of the H-field is controlled by varying the supply voltage (PWM circuit).

Leaving out the 50 Ohms in between, saved several capacitors and inductors.

With kind regards,

Wim

Hi, All.

Brand new to the newsgroup, here, and even though I did the old "Find"
routine, I couldn't find what I need.

Does anyone know where I can get instructions (preferably cookbook, but if
they come with formulas, I can deal with that, too) for building a 2m SSB
horizontal loop? I live in an apartment, which is pretty much a Faraday
cage, but I get out pretty well from my balcony, at least to the east(ish)
of the building. I have a discone out there right now, clamped to the floor
stand of an old oscillating fan that it used to be attached to. :-) I have
a similar portion of a floor lamp that I want to mount the loop onto. I
need something that will cover at least the 180° that my discone can radiate
in, as well as it does. Since 2m SSB is typically horizontal, the discone
doesn't do too well. Any help will be greatly appreciated.

A further note about the 4170 series:
1. A unit now exists that extends the upper range well into UHF.
2. In the last few days, a free software revision transforms Z vs. frequency into time vs. magnitude of Z. In other words, it displays as a TDR would.

Myself I'd probably stick a small 3 el yagi on that
lamp mast if you had room..
Good bit more punch for SSB, and being things are
reciprocal, it will improve reception. If you squeeze
an extra 6 db from the antenna system, that's like
taking 50 watts and turning it to 200.
Best deal on an "amp" you will find.. :)
I'm not sure the gain using a halo, but I suspect
it's probably pretty close to a dipole. Maybe a tad
more, but it's not going to be a drastic difference.
A loop has some gain broadside vs a dipole, but I'm
not sure what you get running one on it's side.

Not very good. Most of the RF goes up. It is particularly bad along the axis of the driven wire (assumes wire driven in the center). Not quite as bad normal to that axis. Might be improvable by feeding the corner.

I think a simple vertical would do better.

Cheers,
John

I forgot that the OP wanted horizontal polarization. Well, if it were me, I'd make the loop vertical and feed the bottom center. That will produce a horizontally polarized signal much better than the horizontal loop and with about the same directivity.

A 'Halo' is the usual answer, or if more space is available crossed dipoles.

Jeff

There is an antenna that Cushcraft used to make called a big wheel.
It had three full wave loops attached in parallel at the center.
I have 4 stacked big wheels which suppress vertical emission and
emphasize horizontal transmission. I have used this on 2M sideband
and FM. If you can get the instructions for a single big wheel from an
old ARRL antenna book, then I can give you some hints on phasing.
I expect that you will only be able to stack 2 on your balcony.

Hello Walt,

The source delivers the stated power in a 50 Ohms load (so the back of the PA mentions 100W into 50 ohms, nothing more). It is the same as for my class E thing, it mentions 500W into 4.5 Ohms load. It doesn't state that the output impedance is < 1 Ohms. So if one provides mismatch (referenced to 4.5 Ohms), the PA may give more net output.

I hope this makes all clear.

Wim

Hello,

I assumed a black box with a voltage source in it with EMF = 213Vrms
and a 100 Ohms resistor in series.

Above the UHF socket it mentions: "100W into 50 Ohms".

Please calculate for yourself the net power delivered into a 50 Ohms
load, and into a 100 Ohms load (VSWR=2, referenced to 50 Ohms). As 50
Ohms is mentioned above the UHF socket, VSWR is referenced to 50
Ohms.

Thanks much. I'll have a look at that link and see what's what. The Yagi
would be nice, but running out on the balcony and moving it around all the
time isn't practical. That's why I wanted something fairly omnidirectional,
as much of "omni" as I can get, anyway. Since I remember what my
communications instructor told us about loops (they radiate equally poorly
in all directions <g>), I figured this would be the most practical solution
for what I want to do.

Another possible idea could be the turnstile.
That is horizontal, pretty omni, and pretty simple
to build. Just a set of crossed dipoles fed 90 degrees
out of phase. I think you would have less gain vs
the broadside of a dipole, but you wouldn't have the
nulls off the ends.

off-topic

Hello Mac,

The Chebyshev is not may favorite filter response, but it gave the required bandwidth increase (from my head more then factor 2).

When using a zero ripple response I had to use more resonating circuits and the client didn't like that. Now there is one straightforward adjustment only (that can be done in the field when required).

With regards to the in-band behavior, I had an almost similar problem in an FM narrow band application that another department couldn't get within specs. They used a very steep Chebyshev filter, but they couldn't meet the internal SINAD spec…. Another filter with less pass band ripple solved the problem.

Two years ago similar problem in an optical receiver. The client was happy that it could be solved by optimizing the digital detection SW.

With kind regards,

Wim

Not for SSB it wouldn't. 20dB or so isolation V to H. Useless unless
within less than normal FM range.

On the flip side I've done well over 100 miles car to car with single
halos on each end with roughly 80 watts. And up to 200 with 2 stacked
halos (3 foot stacking, not much really) to a single 3 wavelength yagi
on the other end. Not a one time thing, I used to drive NNY at about
1000 miles per week doing service during the early 80's.

There are better things than the halo. The omni-angles are quite a bit
better, especially on the pattern and are simple and rugged. Less than
1 dB gain change over 360 degrees toward the horizon. A Motorola design
(that I don't remember them using) that got re-purposed for amateur.

And then there's the Big Wheel and a modern twist on it that is even
better and smaller.

Consider the fact that as it is on a balcony, I assume there is a building
with
a balcony on the side, then you would do with a simple dipole as any
signal sent into the building is only wasted. I am not sure but it would
probably have a good off balcony signal pattern too -- better than most
other antenna arrangements I can think of/

It's cheap and quick and wouldn't take much effort to try.

A horizontal dipole in front of a screen or single reflector would have
a "pattern" that is 100+ degrees wide.

Stack a couple vertically, say a meter apart, and you squeeze the
vertical beam width significantly, which is probably what you want.

What you *might* want to do is look for a low gain TV antenna for the
upper VHF bands (e.g. Channel 7-13): one of those two bay things with a
bowtie in front of a screen.

Let's take an example of a power amplifier, followed by an isolator, and
then your load.

> But Wim, you pulled a fast one one us!!! Until now you didn't tell us
> that the source resistance of the source was 1 ohm!!!

This whole discussion started with the observation that most solid state
amateur amplifiers probably do NOT have an output impedance of 50 ohms,
and that, in fact, the output impedance isn't particularly well defined
(i.e. it changes over frequency and power level).

And, given that, whether you achieve a "match" may not be the best
overall system solution (in terms of AC power in to radiated EM wave)

The problem really is that a simple small signal linear circuit theory
approach (which is what Thevenin equivalents and maximum power transfer
theorem are all about) breaks down, especially when you consider that
actual amplifiers have operating area limits that are some combination
of current, power, and voltage, and that amplifiers and power supplies
have efficiencies that vary a lot depending on the operating point.

Maximum Power transfer/conjugate matching applies only at the single
reference plane, and is convenient for analysis, but doesn't tell much
of the story when it comes to overall system performance.

A related issue is noise figure performance, where a well-matched system
(which would transfer maximum power from the antenna to the LNA)
sometimes isn't what you want, because it's optimally transferring the
noise power from the source resistance.

That's another good idea. Thanks. Are the elements of a turnstile spaced a
quarter wavelength apart, or are they pretty much on top of each other?

Hi Jim,

Taking that example doesn't explain the numbers in Walt's frequently
asked question (which I understand by John KD5YI's header information
was originally your assertion, not Wim's).

>This whole discussion started with the observation that most solid state
>amateur amplifiers probably do NOT have an output impedance of 50 ohms,
>and that, in fact, the output impedance isn't particularly well defined
>(i.e. it changes over frequency and power level).

The whole discussion that stops at that point is jejune. There is
SOME output impedance at SOME operating point and the rhetorical
device of saying it isn't 50 Ohms isn't very informative.

>The problem really is that a simple small signal linear circuit theory
>approach (which is what Thevenin equivalents and maximum power transfer
>theorem are all about) breaks down, especially when you consider that
>actual amplifiers have operating area limits that are some combination
>of current, power, and voltage, and that amplifiers and power supplies
>have efficiencies that vary a lot depending on the operating point.

Consistently across the board, ALL of Walt's papers and publications
have carefully defined the operational criteria to satisfy exactly
those issues and to remove them as objections from "the whole
discussion started with ... output impedance." Ignoring that
contribution, and refusing to argue those points, the critics then
re-inject these issues to condemn Walt's conclusion.

Hello Cecil,

Your assumption is correct! To avoid confusion, I mentioned: "that is
VSWR = 2 for a 50 Ohms reference", but maybe it is because of English
isn't my mother tongue.

I think it is not unusual to use 50 Ohms as reference when the output
specification says: "100W into 50 Ohms".

With kind regards,

Wim

Wim, why is it that you can't seem to answer my question concerning the amount of power reflected from a 2:1 mismatch? The following is what you said in reply, totally ignoring the details in my question:

>The problem really is that a simple small signal linear circuit theory
>approach (which is what Thevenin equivalents and maximum power transfer
>theorem are all about) breaks down, especially when you consider that
>actual amplifiers have operating area limits that are some combination
>of current, power, and voltage, and that amplifiers and power supplies
>have efficiencies that vary a lot depending on the operating point,

Your response above is totally evasive, and I can't understand why you would do this. There is a specific correlation between source power, forward power and reflected power, such that with a 100w source in a 50-ohm system, a 2:1 mismatch, when the reflected power is re-reflected the forward power is 111.11w, reflected power is 11.111w, and power absorbed in the load is 100w.

Now please explain with rigorous physics and math, how with a 100w source and a 2:1 mismatch you can justify a forward power of 130w and a reflected power of 15w. Is the fact that there is no way these values can exist is the reason you're evading answering the question? If someone who is unfamiliar with the truth in this instance came up with these absurd numbers, and who is willing to admit a mistake, I'm willing to forgive a mistake. But if you are stonewalling, is what it appears to be, then I'm not amused. And you should be ashamed for doing it.

Walt, W2DU

Walt -

If the load reflects 11.111... percent of the forward power, and 100%
of reflected power is re-reflected by the source, then how/why in your
example is the power absorbed by the load equal to the original
incident power of 100W?

A re-reflection for these conditions is not 100% absorbed by the load,
rather 11.111% of it is reflected back to the source. Only ~88.889%
of that first re-reflection is absorbed by the load. Ditto for all
further re-reflections of the first reflection.

Assuming no loss in the transmission line, and phase coherence at the
load for all forward power, wouldn't the load power accumulate per the
table below -- which shows the initial forward power absorbed by the
load with the first ten re-reflections of it by the source?

88.889 watts
1.23454321
0.137170096
0.015240969
0.001693424
0.000188156
2.09061E-05
2.32287E-06
2.58094E-07
2.86769E-08
3.18629E-09
- - - - - - - - - -
90.27785937 watts, total

Then the next question is what happened to the "missing" power?

RF

Quite. There's not much point in striving to achieve omnidirectional
coverage if half the RF will be coming back into the building, and
getting lost.

However, in the interests of minimising interference (to and from the
electrical devices in the building), it might be advantageous to
minimise radiation/reception in that direction by using something at
least 'somewhat' directional - maybe a 2-element yagi, or an HB9CV?

It appeared to me that Walt was talking about the SWR in a matched system, i.e. Zs= Z0=Zload=100 ohms. There is rarely an actual technical disagreement between two technical heavyweights because we all studied the same textbooks. :-) Seems to me, about 95% of all technical arguments are semantic in nature.

For instance, from our earlier discussion, I believe that you consider the redistribution of RF energy associated with interference between waves to be a "reflection". To my way of thinking, a "reflection" is something that only can happen to a single wave, i.e. you and I may be presuming a different definition of "reflection" which is a semantic problem.

1030. The Lazy H does not seem to exhibit any gain over a dipole in the real world

Newsgroup: rec.radio.amateur.antenna
Date: 2011-05-10 13:13:36 UTC
From: Michael <google@shadowstorm.com>
Message-ID: <0992ce75-dbbc-4863-bef9-1bcff1e86e33@d27g2000vbz.googlegroups.com>
Source record: 5079

I've been wanting to build a Lazy H antenna for 10 meters for some time now. Last summer I purchased a new house with some land, and I decided to give the Lazy H antenna a try. According to the ARRL handbook a Lazy H antenna with 1/2 spacing between the top and bottom elements has 5.9 db gain over a half wave dipole. At 5/8th wave spacing between the top and bottom elements the ARRL antenna handbook claims the Lazy H is suppose to have 6.7 db gain over a 1/2 dipole. In the real world I have found the Lazy H to actually have less gain than a 1/2 wave dipole at both 5/8th wave spacing and 1/2 wave spacing.
I viewed the W8JI web page concerning the Lazy H. I used 450 ohm ladder line between the top and bottom elements, and I center fed that piece of ladder line with another 100 foot run of 450 ohm ladder line back to the shack. The ladder line runs perpendicular away from the Lazy H. I attached the ladder line to the balanced line input on my Dentron MT-3000 antenna tuner.

Dentron MT-3000
http://www.eham.net/reviews/detail/868

The first thing I noticed is I have to turn the antenna matching adjustment all the way to the right to get the SWR to come down, and the transmitter matching to about 3 o'clock. I've never had to turn the antenna matching adjustment that far for any other antenna to match. I also hooked the ladder line to my Drake MN-75 antenna tuner with the 4:1 balun installed and the adjustments on the Drake antenna tuner where about the same as the Dentron MT-3000.
The top wire on the Lazy H is at about 45 feet. I also have a coax fed 1/2 wave dipole for 10 meters at about 30 feet. I live near Charleston, South Carolina, and I have both the dipole and the Lazy H broadside to southern California.

I did multiple A/B comparisons between the 1/2 wave 10 meter dipole and the 10 meter Lazy H and this is what I found.

Charleston, South Carolina to Arkanasas via sporaic E skip
- The dipole easily out performs the Lazy H

F layer skip....
Charleston, South Carolina. to Arizona
- The dipole easily out performs the Lazy H

Charleston, South Carolina to California
- The dipole easily out performs the Lazy H

Charleston, South Carolina to Hawaii
- The dipole and the Lazy H are about the same

When sporadic E skip rolled in from Ohio the Lazy H demonstrated the expected null to the North.

I have rechecked all the connections and they are correct. I verified the connections with an ohm meter and the top left element is connected to the bottom left element. The top right element is connected to the bottom right element. There is no connectivity between the left and right elements which is what the handbook shows. There is no twist in the ladder line that connects the top and bottom elements. This is a center fed Lazy H, and not a bottom fed Lazy H. I verified the Lazy was in fact pointing in the correct direction by rotation my dipole to null out signals coming from California. I noted the direction with my compass, and then I made sure the Lazy H was broadside to that direction on the compass.

Has anyone seen real world gain with the Lazy H on 10 meters verses a dipole? My experience shows it consistently lags behind the 1/2 wave dipole even through the Lazy H is 10+ feet higher than the dipole.

I also built an extended double zepp for 10 meters with a 450 matching section to a 1:1 balun and then to coax, and the extended double zepp consistently out performs the dipole in it's preferred direction.

Ignore my earlier post in this thread. I used the wrong multiplier.

On further study it appears that the sum of the power contained in all perfect, coherent re-reflections from the source that will be absorbed by the load is asymptotic to the value of the power absorbed from the original incident wave (lossless transmission line).

There are two mechanisms responsible for the redistribution of
incident reflected power on/at the source back toward the load.

1. The incident reflected EM wave energy can be partially re-reflected
from a physical impedance discontinuity at the source and merge with
the forward EM wave energy. Note that "reflection" is something that
happens to a single wave.

2. The components of the reflected EM wave energy that are not
directly re-reflected can undergo superposition with other coherent EM
waves and, associated with destructive/constructive interference,
their energies can be redistributed back toward the load. Some
consider this to be a re-reflection but it is NOT since it involves
superposition of two (or more) EM waves.

Given that b1 = s11*a1 + s12*a2 = 0, what happens to the powers,
(s11*a1)^2 and (s12*a2)^2? If that energy is not moving toward the
source, it is moving toward the load and contained in (s21*a1)^2 and
(s22*a2)^2. That power is NOT a reflection. That's the conservation of
energy principle in action associated with destructive/constructive
interference.

When one calculates the source impedance based on the total
redistributed energy, one makes a large error when one assumes that
all of the redistributed energy is "reflected". It is possible for
there to exist zero re-reflected power while all of the reflected
power is redistributed back toward the load through superposition
associated with destructive/constructive interference. That's exactly
what happens in one of W7EL's food-for-thought#1 examples.

When W7EL's source sees an infinite impedance, there is zero power
dissipated in the 50 ohm source resistor. However, since we are using
50 ohm lossless coax, the Z0 of the coax is equal to the Zg of the
source so there are no re-reflections at the source, according to the
reflection model. Is that a contradiction as W7EL seems to suggest?
Absolutely not! He is simply missing the redistribution of reflected
energy back toward the load as constructive interference in balance
with the destructive interference at the source resistor.

In s-parameter terms, if b1 = s11*a1 + s12*a2 = 0, then all of the
incident reflected power must be redistributed back toward the load -
but not through re-reflection - just a necessary result of destructive
interference at the source resistor. I'm sure they exist but I
personally do not know any hams who understand that fact of physics
well recognized from the field of optics.

Hello Walt,

I thought you would be able to do this yourself, so I only stated the net delivered power to a 100 Ohms load (that is the 111W), though the delivered power into the stated 50 ohms is 100W. The example was to show you with numbers what I experienced in practice when I was 16 years old and repeated it when I had access to good equipment (mentioned before).

In addition, it is not relevant to the output impedance issue of a PA, as you can calculate the increase in power due to mismatch (referenced to 50 Ohms) by just using Ohm's Law.

But here it comes:

We have 111W dissipated into a 100 Ohms load (from the EMF calculation, assuming 100 Ohms Zout for the PA and EMF = 212.1 Vrms). Reference for waves is 50 Ohms (according to the text on the back of the PA: "100 Watts into 50 Ohms"). We assume an electrically very small piece of 50 Ohms coaxial cable between the socket and the 100 Ohms load. This could be your reflectometer. If you like you may insert 0.5 lambda so that the PA sees 100 Ohms.

100 Ohms equals |rc| = 0.3333 (50 Ohms reference), I assume you know how to calculate this.

Hence "reflected power" = 0.333^2*"incident power" = 0.111*"incident power".

"net delivered power" = "incident power" – "reflected power" = 111W.

"net delivered power" = (1-0.11111)*"incident power" = 111W.

"incident power"= 125W, "reflected power" = 14 W

Do you realize that when using transmission line resonators (or filters) the forward and reflected power INSIDE the resonator can be very high, while the net input power can be very low?

Hi Michael,

Then, there you have it (in your last sentence).

With a quick google of "Lazy H antenna" I find two ways to build one
(the difference being in the twist of the shared drive line between
the top and bottom elements when fed at the bottom). There are plenty
to ways to erect it wrong - to someone's sense of propriety.

Now, as to the gain. Commons sense (divorced from the effects of
ground) tell us that if one dipole has X gain, then two with the best
of additive aspects could only have 2X gain (3 dB). To say you can
achieve more than 6dB is another doubling without adding anymore
radiator (and performed only by some unspecified magic).

More the issue seems to be reporting gain. The numbers seem to be dBi
figures that are then compared to a dipole with the presumption the
dipole gain could be expressed as 0dBi.

Lastly, the Lazy H is designed like a two element yagi pointed
directly into the ground (go figure). There is some appeal to this
design being a curtain array (a topic for consideration), but then
what price in gain is being paid with the lower element hugging
ground. It couldn't possible radiate better than a similarly ground
hugging dipole (and yet all the praise seems to ignore this common
sense). The higher element certainly has a better chance, but then so
does a dipole at that altitude. So, how do you compare the two
designs? The simple dipole at the lowest element's position? or the
highest element's position? or split the difference?

Hi Richard,

It doesn't matter what somebody designed in the past. I think my example regarding net power increase due to mismatch (referenced to 50 ohms) was fully clear.

Stressing on forward and reflected power (several times) may give rise to the thought that somebody can't solve such a transmission line problem himself. Note that I wasn't the one that brought up this issue (as Jim noted also), but I know the stated figures aren't strange.

I use a similar example in my antenna measurement classes to show that just calculating additional loss due to mismatch may go wrong completely when Rsource or Rload don't equal the reference impedance (mostly 50 Ohms).

So clear that it has to presume Walt doesn't know transmission line
fundamentals?

>Stressing on forward and reflected power (several times) may give rise
>to the thought that somebody can't solve such a transmission line
>problem himself. Note that I wasn't the one that brought up this issue
>(as Jim noted also), but I know the stated figures aren't strange.

So, by your emphasis on forward and reflected power (several times) I
presume you can expand upon your application of transmission line
mechanics to offer something other than an oblique comment that
nothing is strange about:
>> Now please explain with rigorous physics and math, how with a 100w
>> source and a 2:1 mismatch you can justify a forward power of 130w and
>> a reflected power of 15w. Is the fact that there is no way these
>> values can exist is the reason you're evading answering the question?

If, by any chance of miscommunication, you do find this last quoted statement strange; it would be clarity itself to simply say so and we will wait for Jim to sort this out.

This is for Richard Fry,

Richard, because the output source impedance of a p-network following a tube RF power amp is non-dissipative, no reflected wave enters it to be dissipated. Instead, the reflected power is totally re-reflected back into the line. The only loss from there on is due to line attenuation. The same is true when using an antenna tuner, total re-reflection. Thus, when ignoring the line loss, with a source power of 100w and a load mismatch of 2:1, the reflected power after reaching the steady state is 11.111w, and when added to the source power, the forward power is 111.11w.

Here is what I believe you missed: When the 111.11w arrives at the mismatch, 11.111w is reflected, leaving 100w dissipated in the load.

Correction for Richard Clark: My designs were for the dish antennas that went on the Moon buggies, and the antennas that flew on the 1st nine weather satellites. I also designed one of the quadrifilar helix antennas now flying on the polar-orbiting NOAA weather satellites. Not Telstar.

Now Wim, your math is very challenging: You state 100w delivered by the source, but at one point you also state 111w is delivered to the 100-load--at another point you state that 100w is delivered to the 100-ohm load. Which is it?

You also state that voltage out of the source is 212.1v--sum ting wong here. 212.1v across 50 ohms yields 899.73w, and 212.1v across 100 ohm yields 449.86w. These power values are nowhere near the values appearing in you statements.

In my calculations, with 100w the voltage across a 50-ohm line is 70.71v, and across a 100-ohm line the voltage is 100v.

With a 50-ohm line terminated in 100 ohms, the vrc is 0.3333 as you stated, thus the power-reflection coefficient is 0.1111. This means, as I've stated continually, that with 100w delivered by the source, the power reflected at the 2:1 mismatch is 11.111w, which when added to the 100w supplied by the source, makes the forward power 111.11w. Now with 11.111w of power reflected at the mismatch, this leaves 100w delivered to the 100-ohm load, not 111w. Please tell me where the 111w came from. You also haven't told us why you calculate 130w forward and 15w reflected. Someone else may have made these calculations, but it was you I asked for an explanation, because you repeated those calculations.

When using the correct physics and math in this example, how can the results be so different?

To close, let me present the procedure I use to calculate the total forward power--I guess it is related to Ohm's Law:

With the power-reflection coefficient as prc, the forward power PF = 1/(1 - prc).

So Wim, can you clarify the confusion you appear to have made?

Walt

Walt,

Let us start at T=0. The transmitter is keyed, and instantaneously delivers 100W to the input of a lossless transmission line. That 100W travels to the end of the transmission line and encounters a load connected there having a 2:1 mismatch to the Zo of the transmission line.

That load will dissipate about 88.889W, and reflect about 11.111W back to the source.

Likewise, the load will dissipate only 88.889% of the RE-reflected power from the source for the same reason it dissipated only 88.889% of the power in the original incident wave.

So even if the RE-reflection from the source is lossless, and phase-coherent with the original incident power at the load, how does this yield the 100W of load dissipation that you posit?

RF

The PI network between the tube and the output connector transforms
the tube Hi-Z to 50 Ohms (or any other suitable Z); however, the same
PI network's input Z (from the perspective of the returning, original
reflection) is NOT 50 Ohms, it is the complex conjugate (whatever 2:1
brings to the table) of the load answering phase-coherency, hence it
reflects the reflection (by the same mechanism of mismatch) to the
dissipative load the antenna, and thus into the ï¿½ther.

The transmission line is bounded at either end by identical mismatches
in conjugation. There is a "ringing" in the line, which at only one
end there is dissipation (neglecting loss and damage to the tube for
exceeding maximum tolerances, of course).

For Richard F.

Where does the 88.889w of power delivered to the load come from? I calculate it as 100w. 100/111.11 = 0.9000. Since 11.111w of power reflected at a 2:1 mismatch with a 100 source and lossless line is indisputable, then the mismatched load will dissipate 90% of the forward power. 90% of 111.11w is 100w. So please explain the significance of 88.889w. I can't see it as relevant.

Walt

Richard, the point I missed until rereading your post, is that there is total re-reflection of the reflected wave at either the output of the correctly-adjusted pi-network, or at the output of the antenna tuner, not the same mismatch as between the line and the load.

If, as you have posted, dissipation occurs only at one end of the transmission line -- which presumably for the most useful benefit would be at the end of the line opposite the source, e.g., the load -- and the incident power generated and delivered to that line by the final r-f stage in the transmitter is a constant, then how could "damage to the tube" occur?

Just to note that as a field engineer for RCA Broadcast for many years I have had to troubleshoot and repair failures that occurred in transmission lines, transmitters, and output networks that resulted from reflections -- either from within the transmission line alone, or together with the load connected at its far end.

Yes, Walt, 100/111.11 = 0.9.

But a transmitter generating 100W does not deliver 111.11 watts in the original incident wave arriving at a load VSWR of 2:1 w.r.t a lossless transmission line used to convey that power. It delivers only 100W.

Of that 100W, 88.889W is absorbed by the load, and 11.111W is reflected back to the source.

THAT is where the 88.889W comes from.

Also note that 0,9 does not equal 0.8889.

Hi Richard,

Note how you were careful to specify "phase coherent."

This is dangerous to speak of power in this way, energy would be
better, but I will proceed with caution thrown to the winds:

When the reflection hits the transmitter port, it sees the conjugate
of the load. As the load was 2:1 (and trusting everyone's math with
my own rounding) this means that the transmitter port also presents a
2:1 mismatch at this near end of the coax. Some (10%) of the power in
the reflection is re-reflected to the load. Some (90%) of the power
in the reflection re-enters the transmitter to add to the next cycle
of power going out. In this scenario, that amounts to 9W going into
and being coherently impressed upon the tube. The transmitter, then,
becomes a buck-boosted 109W source conjugately matched into a 2:1
mismatched load.

9 additional watts at the plate isn't much, but I dare say there are
many problems with transmitter tolerances even if you could tune into
a short, or an open. Yes, somewhere the SWR meter says everything is
hunky-dory, while the smoke is poring out.

Another way of putting it is saying the ringing line is holding 10W
until it is dissipated. So far, only the antenna qualifies as
dissipation.

Through the magic of Integral Calculus, all the bits and pieces
ringing around the system sum up to the whole numbers we started with.

No doubt this will provoke examinations, re-examinations,
cross-examinations, innuendo, rants, and raves (or possibly disdainful
silence) - something for everyone to enjoy. ;-O

Yes Richard, I'm familiar with your work at RCA Broadcast Div.
However, in my posts I'm concerned only with tube rigs used in the
Amateur Service. In these rigs reflected power doesn't cause
overheating, or other damage to the tubes. But I'll qualify that
statement--if the pi-network is originally resonated into, say, a
dummy load, and is then switched to a mismatched line without
retuning, the reactance appearing at the input of the mismatched line
detunes the network and the result is the same is if the network was
left off resonance initially. As you well know, a mis-tuned pi-network
results in excessive plate current, which, if high enough will damage
the tube. Consequently, it's the mis-tuning that causes the damage,
not the reflections per se.

Incidentally Richard, I was also an electrical engineer with RCA, from
1949 thru 1980, first at the RCA Labs in Princeton and beginning in
1958 with Astro.

Apparently you have never had to repair the components of a
transmitter PA, an output network, or a transmission line that arced
over and/or melted down due to load reflections (coherent, or not).

Hi Walt,

The mismatch, of the reflection wave approaching the transmitter, is seen at the antenna/tuner connection. Hence we have a reflection there back to the load.

In regard to solving the transmission line problem where the mismatched load acts as the source of energy (found in the reflection); then that energy must travel to meet a matching load where the load (our transmitter) complete takes it in, or a mismatch where some energy passes into the load (our transmitter) and some is reflected according to the conventional mechanics of mis-matching.

I take this step given the evidence of physics and reflection at even the most specular of surfaces. There is some portion of the energy that exists within a quarter wave behind/beneath the surface of a reflector (I am speaking of light, but lower frequencies doesn't alter the situation). That is to say, there is no infinitesimally thin boundary through which energy does not pass - even for a perfect reflector.

In antennas, we call this zone the reactive field.

Hence, the reflection seeing the mismatch of the tuner/tuned output, finds its way beyond the connector, back into the internals, passing through transform circuitry.

To Richard C:

Richard, I must totally disagree that the same degree of mismatch occurs at the tx output as at the dissipative load, the antenna. As I have said many times, with the non-dissipative output source impedance of the RF amp (tubes) the reflection at the junction of the line input and the pi-network output is total. In other words, all of the reflected power incident on the output of the pi-network is TOTALLY re-reflected. Can't be anything less!

To Richard F. And I disagree that the load mismatched at 2:1 absorbs 88.8889% of the forward power. It is 90% !!! We are discussing steady-state values, in which arrival of the first forward wave is irrelevant. If you are so confident that the number is 88.8889%, please derive the conditions that yield that number.

I never thought I'd be having this discussion.

Walt

Hi Walt,

There's an active load behind that 2:1 mismatch seen by the reflected
power returning from the load. That is my part of the discussion.

However, if you are going to neglect that interpretation, then there
must be some explanation for TOTAL reflection. Fortunately there is,
it is called an open, or a short.

Now, we come to a philosophical quandry of the "Conjugate Match." If
we tune to a load, and we guarantee that the tune is the conjugate of
the load, then at any point along the transmission line in between
there exists looking at either end a conjugate of the opposite end.

In other words, putting a network analyzer into the line looking at
the load it sees R +jX, and looking back at the source it sees R -jX.
This is conjugation. Moving the analyzer along the length of the line
will transform R and X, but they will always track to a solution of
the conjugate.

You've been arguing this for years.

And, as the load is neither a short, nor an open (which is a special
solution of conjugation); then it stands to reason it is something
other which necessarily demands a solution in the form of:
R ï¿½jX
from the source, where R has some non-zero, and non-infinite value.
For trivial antennas, that value of R falls somewhere between the 10s
of Ohms and the 100s of Ohms. For trivial, retail transmitters
available to Hams, similar values of R abound but most often fall
closest to 50 Ohms, or they would have a hard time getting optimal
power into the 50 Ohm pipe. Vendors are not going to shoot themselves
in the foot before that race.

A TOTAL reflection is available courtesy of the "active" part of this special load. The "active" load (the transmitter sinking the reflected power from the dissipative load) can offer one of two mechanisms to provide the necessary short or open. When the source wave coming out meets the returning wave coming in, and they are phase coherent at 0 degree difference, then there is no potential difference through the connector - no current flow. No current flow = open circuit. Open circuit satisfies TOTAL reflection mechanics (but violates conjugation). If they are phase coherent, but 180 degrees different, then there is maximum current = short circuit. Short circuit satisfies TOTAL reflection mechanics (but violates conjugation).

However, in either of these scenarios, both powers (actually energies) must be equal. Obviously that isn't the case with a nominal 100W source looking at a 10W reflection.

Hence the analysis draws out slightly more along the lines I've already posted and won't repeat here.

However, for the sake of argument, the condition of tune (conjugation) and the state of coherency (a slippery slope, but here we are), combine through a ringing in the line to create a virtual TOTAL reflection at the connector of the Tuner/tuned amplifier. So, Walt, I am not denying your case, but in the earlier posting I do preserve conjugation in the explanation.

No transmitter, even with the best of tuning attempting to match will forgive a short or open as load however. And, yes Richard, I have experienced such conditions with 10s of W to 100s of kW and not all of them accidental.

Another issue of moving sensors along the transmission line between high mismatches is that there will be considerable error in the determination of power - I presume this is where Jim's bookkeeping explanation will lead, but that is still hanging on the line (no pun there). I have experience the difficulty of those conditions too when making precision power measurements.

Γ = R(load) - R(source) / R(load) + R(source)

SWR = (1 + |Γ|) / (1 - |Γ|)

Power Accepted by the Load = Incident Power * (1 - Γ^2)

For a 50 ohm source connected to a 100 ohm load:

Γ = (100 - 50) / (100 + 50) = 50 / 150 = 0.333333...

SWR = (1 + 0.333333) / (1 - 0.333333) = 1.333333 / 0.666666 = 2:1

Load Power = Incident Power * (1 - 0.333333^2) = Incident Power *
0.888889 (or 88.8889%)

The answers are the same for a 50 ohm source with a 25 ohm load.

Or expressed another way a 2:1 vswr equates to a return loss of 9.542dB
and so a mismatch loss of -0.512dB which equates to 0.888 or 88.8% .

It may be possible to get the performance of the Lazy H antenna up by matching it at the antenna with a 1/4 matching stub, but clearly running 100 feet of 450 ohm ladder line from the center of the Lazy H back to an antenna tuner does not work very well on 10 meters. I took the Lazy H down yesterday and put up the previously mentioned extended double zepp using the same support ropes, and the extended double zepp out performed the dipole on every A/B comparison in it's preferred direction.

May I suggest that we simplify the example by removing the tuner from
the discussion?

100w--+----1/4WL 100 ohm feedline----200 ohm load

Same conditions as before. The voltage reflection coefficient at the
load is 0.3333. The power reflection coefficient at the load is
0.1111. A 50 ohm Z0-match exists at point '+' without a tuner. No
reflected energy reaches the source.

Hello Walt,

The source (that is the PA in this case) produces an EMF (as mentioned before) of 212.1Vrms, Source impedance is 100 Ohms (so forget the "conjugated match" thing for this case).

When terminated according to the numbers above the socket ("100W into 50 Ohms"), this results in 100W (Vout = 212.1*50/(50+100) = 70.7V, just a voltage divider consisting of 100 Ohms and 50 Ohms).

70.7V into 50 Ohms makes 100W.

Now we remove the 50 Ohms load and create a mismatch (referenced to 50 Ohms), by connecting a 100 Ohms load (VSWR = 100/50 = 2)

Now the output voltage will be:

Vout = 212.1*100/(100 +100) = 106V

106V into 100 Ohms makes 112W (forgive me the one Watt difference).

This all without any transmission line theory.

Now the forward and reflected power balance (this is exactly the same as in my previous posting, except for using 112W instead of 111W):

100 Ohms equals |rc| = 0.3333 (50 Ohms reference).

Hence "reflected power" = 0.333^2*"incident power" = 0.111*"incident power".

"net delivered power" = "incident power" – "reflected power" = 112W.

"net delivered power" = (1-0.11111)*"incident power" = 112W.

"incident power"= 126W, "reflected power" = 14 W

As far as I can see, there is nothing new with respect to the previous calculation, except for the truncation/rounding.

Similar reasoning can be applied to my class-E PA. It is designed for 500W into 4.5 Ohm, but the output impedance is below 1 Ohms. If you try to achieve conjugate match, you fry the active devices. Same is valid for most audio amplifiers, they may mention: "80W into 8 Ohm", but that does not mean that Zout = 8 Ohms.

Awaiting your comment,

Wim

To Walt: (Steady state) Load conditions can be specified in many forms
(complex impedance, complex reflection coefficient, VSWR with phase,
etc), but depending on the actual integral of the Vp*Ip product, the
plate's dissipation may decrease or increase (due to a load change).

So changing the load (without retuning as you mentioned below) may put
your tubes at risk. Your qualification below seems to contradict your
statement above.

To Richard C.: It seems to me that you're overlooking the fact that
the source resistance appearing
at the output terminals of the pi-network is non-dissipative, and thus
cannot absorb the energy in the reflected wave incident on it. The
resistance is E/I and therefore non-dissipative, has a real value and
is thus a part of the conjugation. The result is total re-reflection,
no transfer of energy into the amp. I thought I'd made this very clear
over the years.

To Richard F. My humble apology for my moronic error. My bad!!! I
can't believe I was so stupid as to not know where the 0.888889 came
from. Thanks for spelling it out for me. I got totally sidetracked
with the 100/111,11 = 0.90, and didn't see any farther.

Wim: I'm working on your response--it's finally beginning to make
sense--gimme a few more minutes.

Walt

Hi Michael,

And for the double zepp, that merely confirms what is reasonable. By
virtue of its length and phase relationships, its investment above and
beyond the dipole tracks with gain.

However, matching stubs are not going to discover the missing gain for
the Lazy H.

As for 100 feet of 450 Ohm ladder line - nothing wrong with that, even
at 10 meters.

I've never tried one, so can't say from experience.
But that you have to use extreme tuner settings to match
the system tells me you may be seeing a good amount of loss.
And then you have the issues Richard mentioned on top of that.
The coax fed dipole is very efficient. Very little system loss
involved. So even if it had less directional gain, it's possible
that gain could be offset by matching losses. Or even driven
negative if the loss was extreme. :(
Compare the two on a dead frequency just listening to noise.
If the H seems real quiet compared to the dipole, I would
suspect excess tuner loss. If they are about the same, may be
other issues.

The only phased dipoles I ever ran were parallel horizontal
dipoles. I would steer the pattern by changing the phasing.
Usually by adding lengths of feed line. It worked pretty well.
That was on 40m.. But as mentioned, there is only so much
blood that can be squeezed from two elements, even if configured
in an optimum manner, say as with a yagi or whatever. :/

I rebuilt the center fed Lazy H twice with different pieces of 450
ladder line, and I installed it in two different locations. I used two
different antenna tuners. I built it exactly as specified in the ARRL
antenna handbook. Both times the antenna exhibited a high SWR and
poor performance compared to a mono band dipole for the same frequency
and at about the same height. I suspect the underling problem may be
too many arm chair antenna experts plugging their designs in to
computer antenna modeling software, and not enough people actually
going out in the backyard and building the antenna and comparing it's
performance to a real world dipole for the same frequency. There are
many web pages touting the supposed gain of the Lazy H with EZNEC
plots posted as supporting evidence, but real world performance has
